Boudiaf (2010), Correction to "Tectonic inheritance and Pliocene-Pleistocene inversion of the Algerian margin around Algiers: Insights from multibeam and seismic reflection data," *Tectonics*, *29*, TC3099, doi:10.1029/2010TC002716.

[1] In the paper "Tectonic inheritance and Pliocene-Pleistocene inversion of the Algerian margin around Algiers: Insights from multibeam and seismic reflection data" by Strzerzynski et al. (*Tectonics*, *29*, TC2008, doi:10.1029/2009TC002547, 2010), the geological feature named "Anticline 3" on Figures 6 and 7 and in the caption of Figure 7 should read as "Anticline 2." The corrected figures and caption are given.

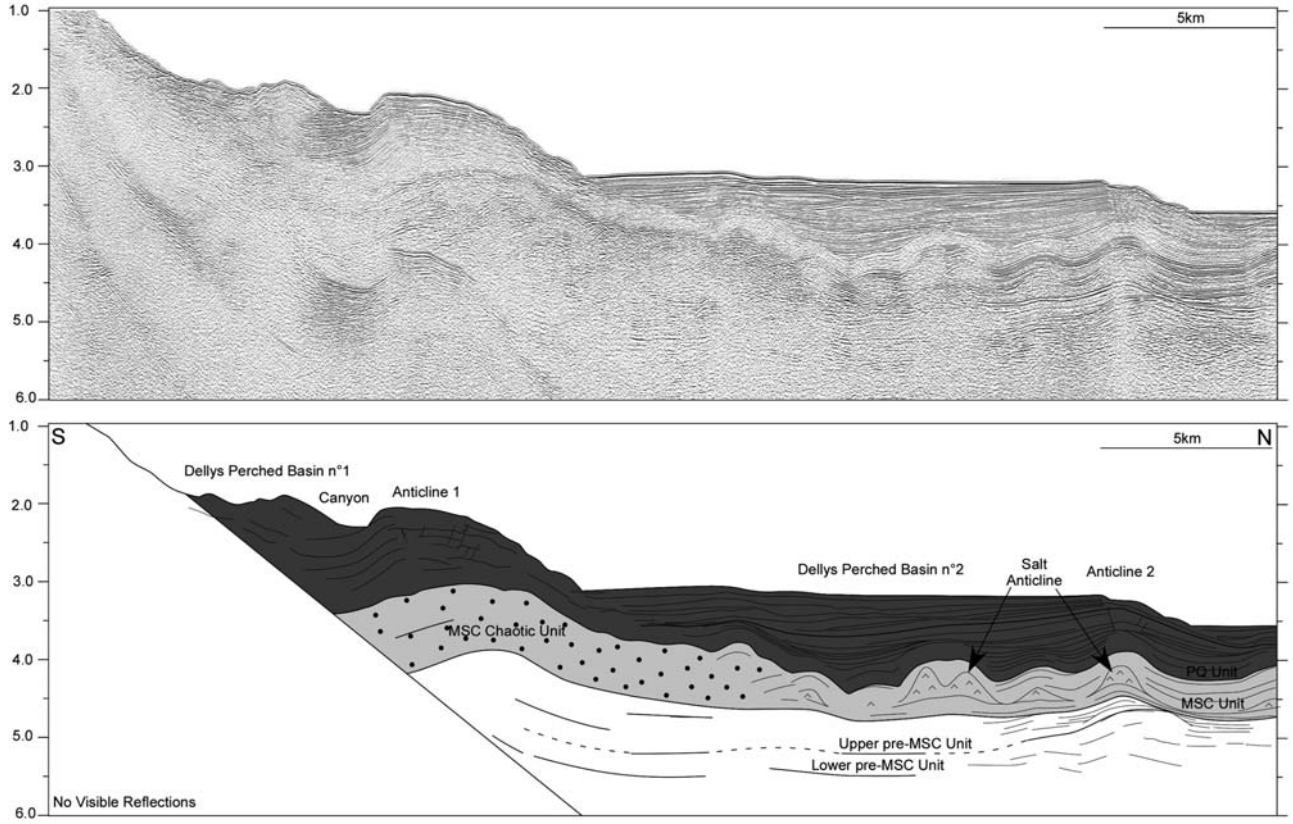

Figure 6. Seismic section and line drawing of a representative six-channel seismic line across the Algerian margin, east of Algiers, off Dellys, crossing the Sebaou canyon on the slope (location in Figure 3). Vertical scale is in two-way travel times (TWTTs) in s. Vertical exaggeration is 3× at the seafloor.

0278-7407/10/2010TC002716

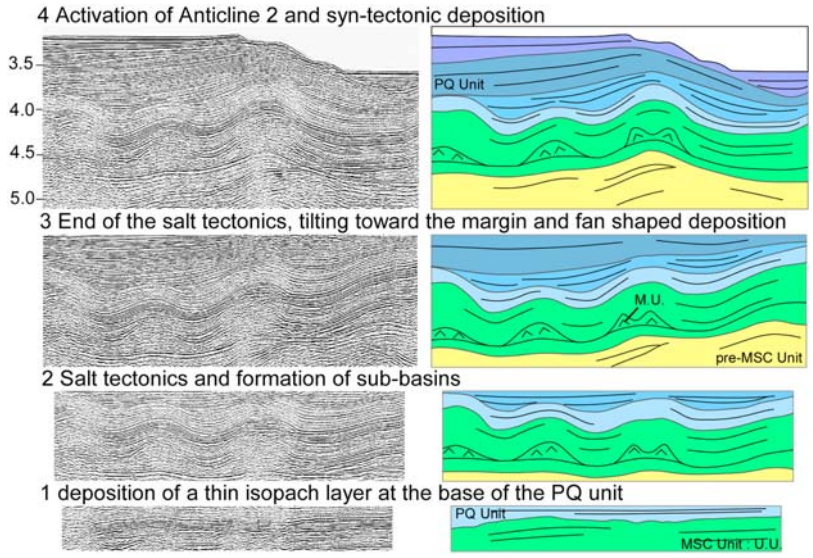

Figure 7. Four steps of Plio-Quaternary evolution of Anticline 2 (see Figures 5 and 3 for location) using "flatten" and "unflatten" functions of Kingdom Suite software. The evolution of the area is characterized by the formation of a salt anticline prior to the onset of tectonics along Anticline 2. Vertical scale is in TWTTs in s. Vertical exaggeration is 3× at the seafloor.
