Variations des sels nutritifs

b) NITRATES

This dual-axis line graph tracks nitrate levels over a year. The left y-axis represents concentration in $\mu\text{atg N-NO}_3/\text{l}$, ranging from 0 to 50. The right y-axis represents concentration in $\mu\text{g/L}$, ranging from 0 to 700. Two series are plotted: 'Hors Zone' (dashed line) and 'Site' (solid line). Both series show a general upward trend from January to December. A major peak for both occurs in June, with the Site series reaching approximately 38 $\mu\text{atg N-NO}_3/\text{l}$ or 490 $\mu\text{g/L}$.
