

FIRST RECORD OF *ERYTHROICLES MONODI* (EMMELICHTHYIDAE) IN THE NORTH-EASTERN ATLANTIC. Marie-Noëlle de CASAMAJOR, UPPA - Laboratoire IFREMER, B.P. 3, 64310 Saint-Pée-sur-Nivelle [decasa@st-peee.inra.fr] et GEMFA, Groupe d'Étude Marine de la Faune Atlantique, B.P. 75, 40130 Capbreton, Alexandre DEWEZ, GEMFA, & Jean-Claude QUÉRO, IFREMER, Place du séminaire, B.P. 7, l'Houmeau, 17137 Nieuil-sur-mer, FRANCE.

RÉSUMÉ. - Première capture d'*Erythrocles monodi* (Emmelichthyidae) dans l'Atlantique nord-est. Les conditions de captures aux abords du Gouf de Capbreton et les caractéristiques biométriques de ce spécimen sont présentées.

Key words. - Emmelichthyidae - *Erythrocles monodi* - ANE - France - First record.

One specimen of Crimson rover, *Erythrocles monodi* Poll & Cadenat, 1954, was caught for the first time in the North-eastern Atlantic at 43°40'N and 1°44'W (Fig. 1) by the vessel "Oiseau des îles", 6-7 nautical miles off Capbreton, Bay of Biscay, in August 1997, at a depth of 130-140 m, by mesh net. Biometric data are presented. This specimen agreed with the descriptions available in the literature (Heemstra, 1972).

It is deposited in the collection of the Muséum national d'histoire naturelle, Paris (MNHN 1999-1215).

Of the five species of the genus *Erythrocles* in the Atlantic, Indian and Western Pacific Oceans, *Erythrocles monodi* is the only species in

the Atlantic Ocean. In the Eastern Atlantic, *E. monodi* has been collected from off Mauritania and Senegal, the Gulf of Guinea, and off the mouth of the Congo River (Heemstra and Randall, 1977; Heemstra, 1990). It is a representative of the benthopelagic ichthyofaunal community of the outer continental shelf.

Body colour of our specimen was predominantly reddish pink dorsally (Fig. 2) and silvery ventrally. Measurements taken according to Heemstra and Randall, 1977, are given in table I. Fin ray, gill-raker and lateral line scale counts are given in table II according to Heemstra and Randall (1977).

A mouth without teeth and the well developed distinctive supramaxillary bone are the main characters that distinguish this family from the other percoids. The lateral line is single and ends at the caudal fin base; the caudal peduncle has a low mid-lateral keel on each side. The dorsal fin is divided to the base, but without a distinct gap between the two fins.

The stomach was empty. It appears that the species of this family feed on large zooplankters (Heemstra and Randall, 1977; Nor et al., 1985). The biology of this species is not known.

Acknowledgements. - The authors acknowledge Patrick Lafargue fisherman on the vessel "Oiseau des îles" and Rinaldo and Patrick Trentin who gave us information about this record.
