

- S Pouliquen , V Thierry, C Coatanoan, F Gaillard, PM Poulain & al.

ARGO

part of the integrated global observation strategy

Main activities

- Coordination of Float Deployments in the Atlantic
- Delayed Mode QC:
 - Networking on the methodology : mainly between France and Germany
 - Improve reference database in the North Atlantic
 - Data sharing among the RDAC partners
- Improve climatology in the North Atlantic
- Data consistency at Basin level
 - **Warning: The method is still in development**
 - The goal is to point out suspicious profiles, not to propose and apply a new correction. Floats remain under the responsibility of the operator and the PI it “belongs” to.
- Mediterranean Sea Activities

Float deployment coordination

- NARDAC performs a regular monitoring for deployment coordination
The goal is to achieve a regular density of one float per 3*3 degree
Red : the float density is correct

planned
deployments

January 2006

September 2006

Network monitoring

- NARDAC performs a regular monitoring for all deployed floats

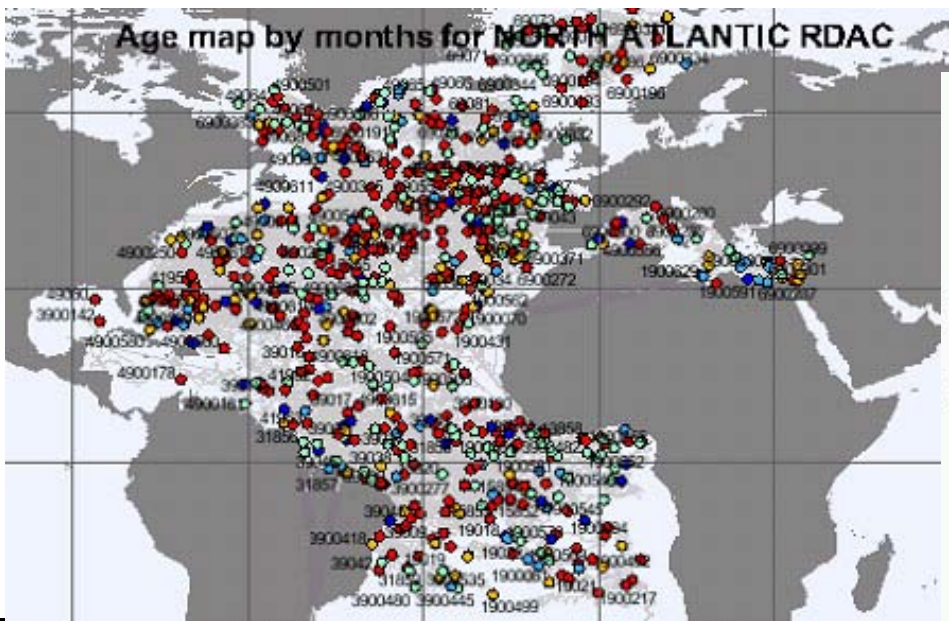

Argo workshop in Ghana, December 2006

NORTH ATLANTIC RDAC							
777 floats - 336 active on 25/10/2006							
All Floats			Active		Inactive		
Deployed	Active (%)	Number of performed profiles	Maximum number of performed cycles	Average number of cycles	Maximum number of performed cycles	Less than 5 cycles performed (%)	Average number of cycles
777	43.24	59411	274	80.2	379	4.08	71.29

2007-2008 deployments forecast

Argo workshop in Ghana, December 2006

- Netherlands 4-8 in 2007
- France 40-50 in 2007 & 2008
- Germany : ??? 2007 30-50/year starting 2008
- UK: 6 in 2007 ?
- Italy 0 2007 ?? 2008
- Spain ???
- Ireland ???
- Norway ???

- EURO-Argo: a proposal is under construction to get funds for a European contribution to ARGO of about 250/year. Should be a trial year in 2008-2009

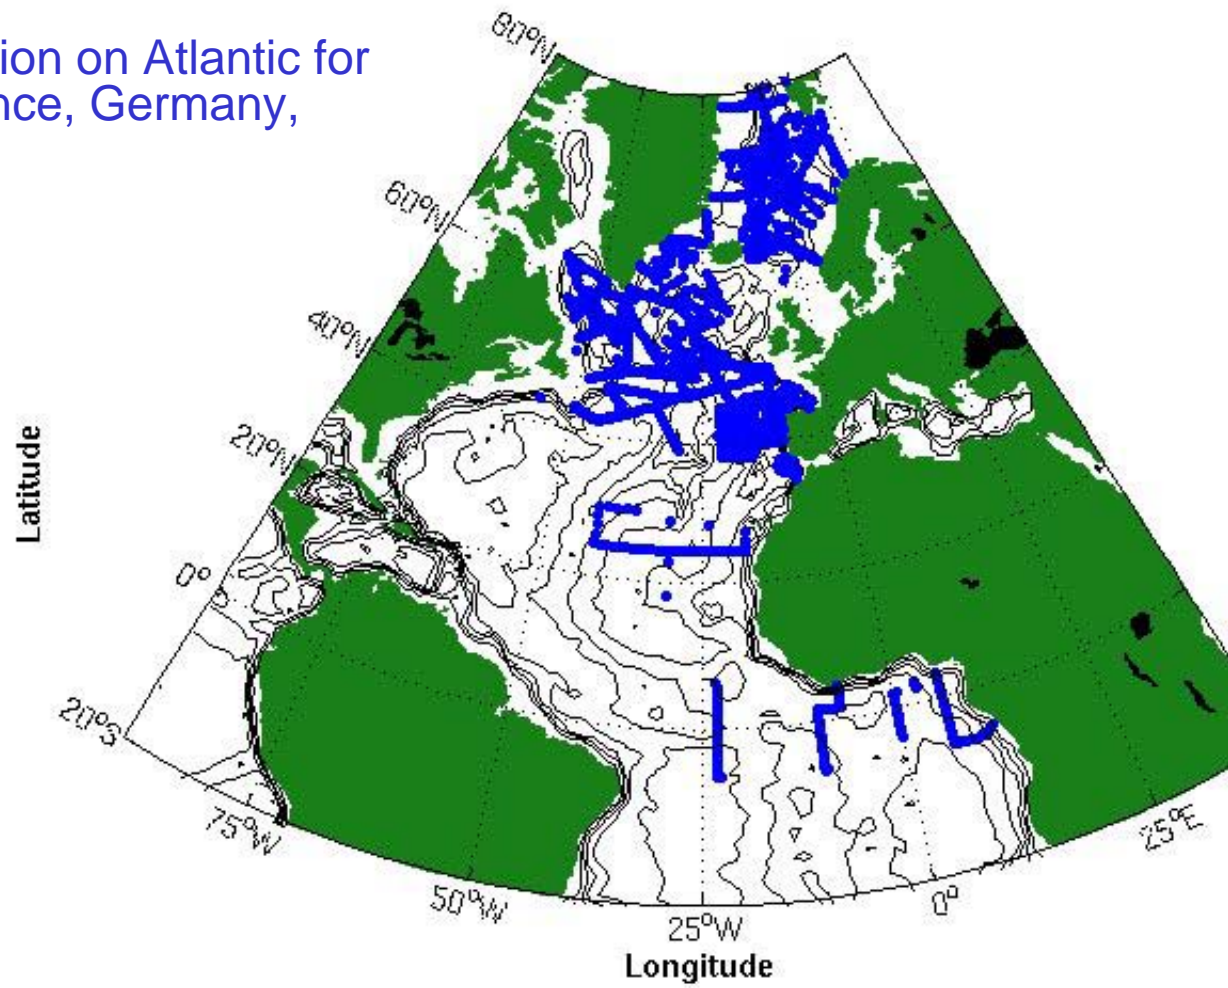

ARGO

part of the integrated global observation strategy

Delayed Mode Activities

- Close collaboration between France and Germany on delayed mode processing methods
- Starts of CTD collection on Atlantic for RDAC partners (France, Germany, Canada)

Data consistency over North Atlantic

P. Galaup, V. Thierry, C. Coatanoan, E. Autret, F. Gaillard,

Sismer and Laboratoire de Physique des Océans Brest, France

Dataset

Coriolis dataset:

ARGO profilers, CTD/XBT, buoys and moorings

Good and probably good data are fed as input to the analysis system

$$0 < QC < 3$$

1 analysis /week from January 2001 to December 2005 with a temporal window of +/- 21 days

CORA-RT : analysis with only real-time data

CORA-DM : ARGO real-time profiles are replaced by delayed-mode profiles when available

Configuration

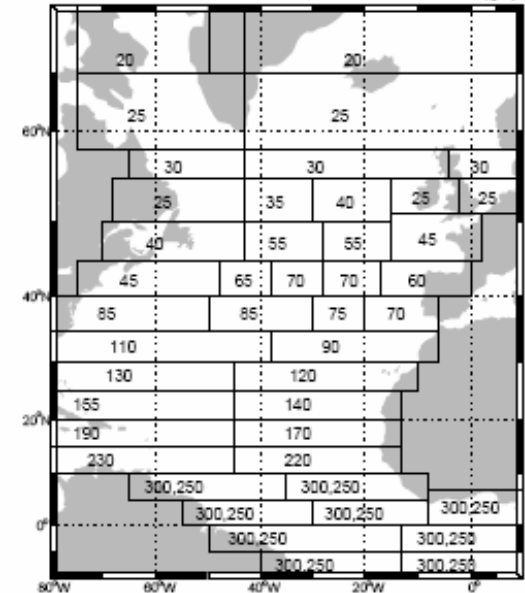

shop in Ghana, December 2006

- Reference: Levitus 98 adapted by MERCATOR
- Horizontal grid: 1/2°
- 59 levels (5 to 2000 m)
- gaussian covariances C(dx, dy, dt)

$$\sigma_{tot}^2 = \sigma_{LS}^2 + \sigma_{MS}^2 + \sigma_{UR}^2 + \sigma_{ME}^2$$

- LS = 300 km, MS ~ Rossby Radius

Sub-areas and covariance Meso scales x,y (kr)

T: a priori standard deviations (deg C) at 100 m

S: a priori standard deviations (psu) at 100 m

ARGO Dataset consistency

Comparison of CORA-RT and CORA-DM

As in real-time and operational mode, residuals from the analysis are used to detect suspicious profiles / profilers

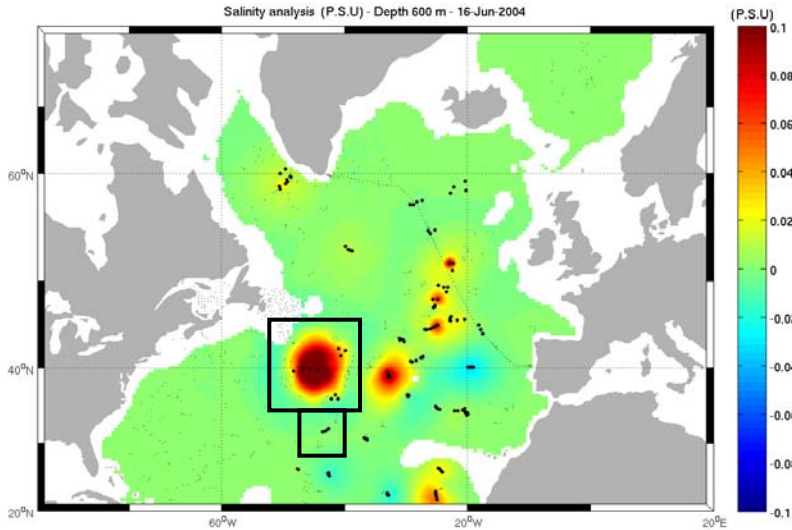

The method has been tested on the North-Atlantic : 20°N-70°N, 80°W-10E

Two analyses have been performed:

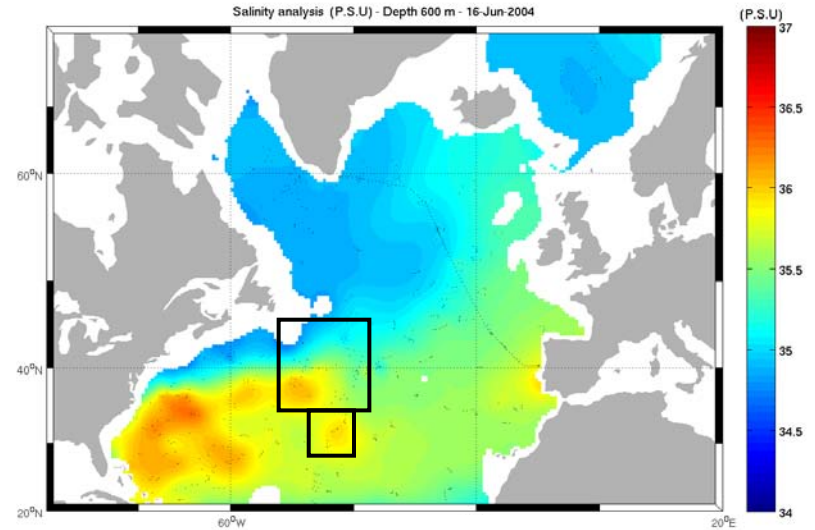

1. using 77 DM floats from the DAC Coriolis
2. using 149 DM floats from various DACs

Salinity field at 600m depth on the 16th of June 2004

Cora-DM- Cora-RT

Cora-DM

Impact of the DM data :

- new information consistent with RT data
- new information in a frontal zone induces large differences

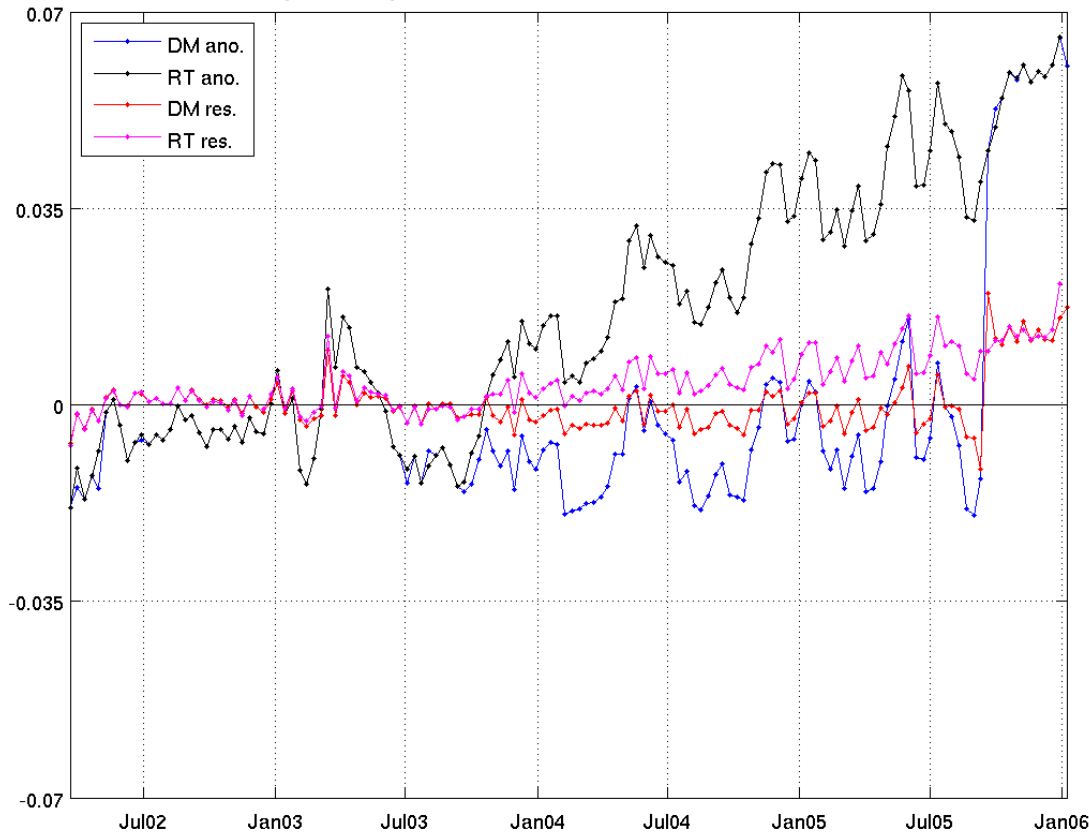

Residuals analysis

2006

1900073 (1600 -1950 m)

T 1900077 - T (blue, in deg.C), S (red, in psu) residual means

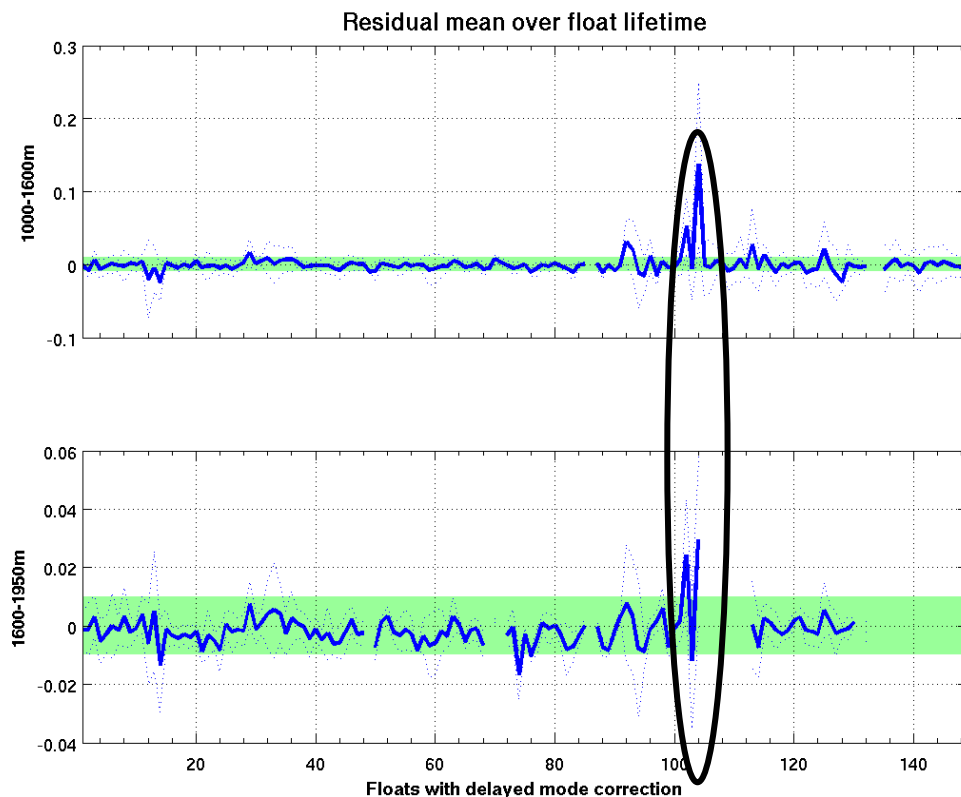

S

Identification of suspicious profiles / profilers

Shana, December 2006

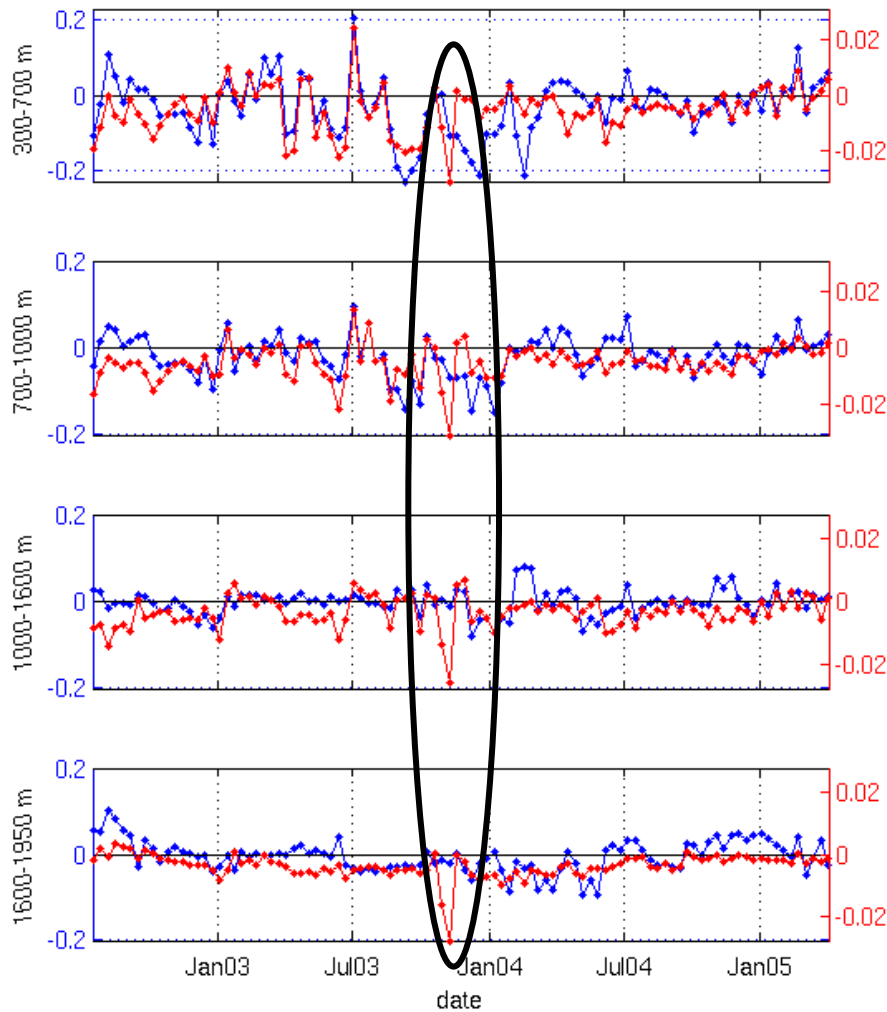

- Screening residuals time-series
- Greater attention to floats with
 - delayed-mode data with a QC=2
 - large mean residuals over their life time

Few floats have mean residuals greater than 0.01 PSU.
None of them are problematic :
short life time, salinity and
temperature anomaly correlated,
Med water influence, etc..

Case 1: suspicious profiles

4900130 - T (blue,in deg.C), S (red,in psu) residual means

4900225 - T (blue,in deg.C), S (red,in psu) residual means

Case 1: Suspicious profiles

- Among the 11500 delayed mode profiles that enter the analysis system, less than 5 were bad
 - the DMQC processing is rather good
- However, for the overall quality of the ARGO data set, it is worth being able to detect them
- The analysis system allows to do it in a rather efficient way

Case 2: suspicious offset

- Few profilers exhibits a negative 'suspicious' offset :

- 4900133 (corrected)
- 4900135 (not corrected)
- 4900136 (")
- 4900227 (")
- 4900497 (")

Case 2 : suspicious offset

- They all are located in the same area

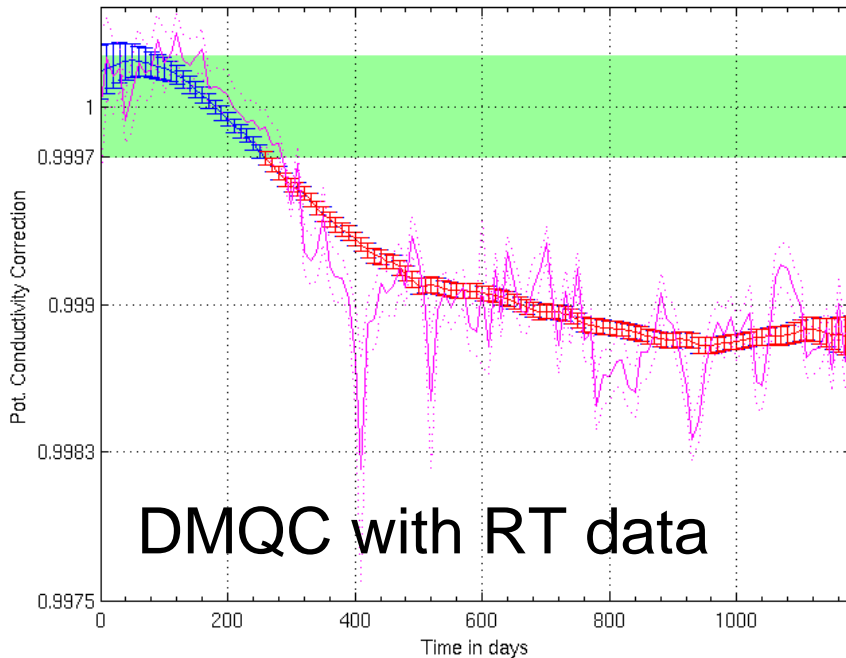

ember 2006

Case 2 : suspicious offset

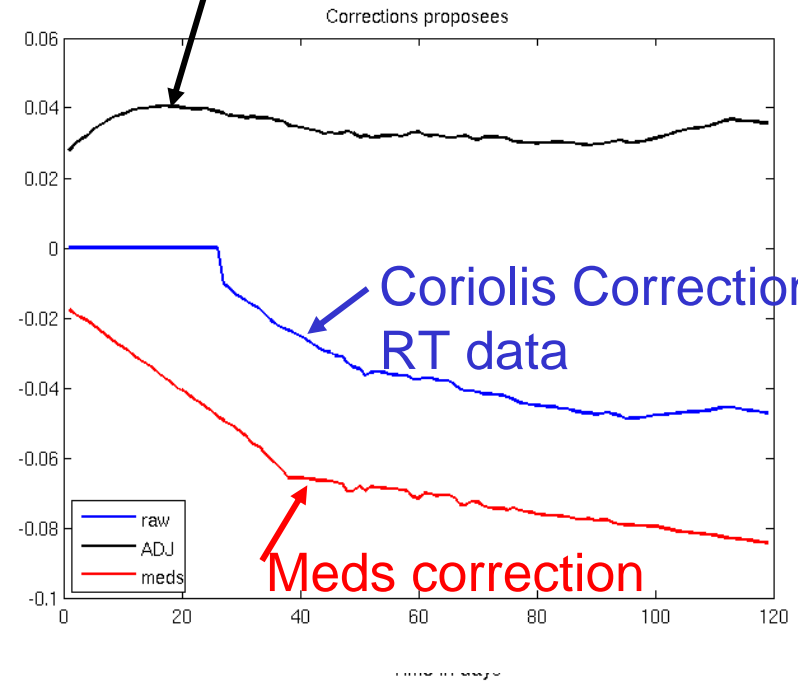

2006

Correction of Float: 4900133

DMQC with RT data

4900133 Coriolis Correction on DM data (MEDS)

Coriolis Correction on RT data

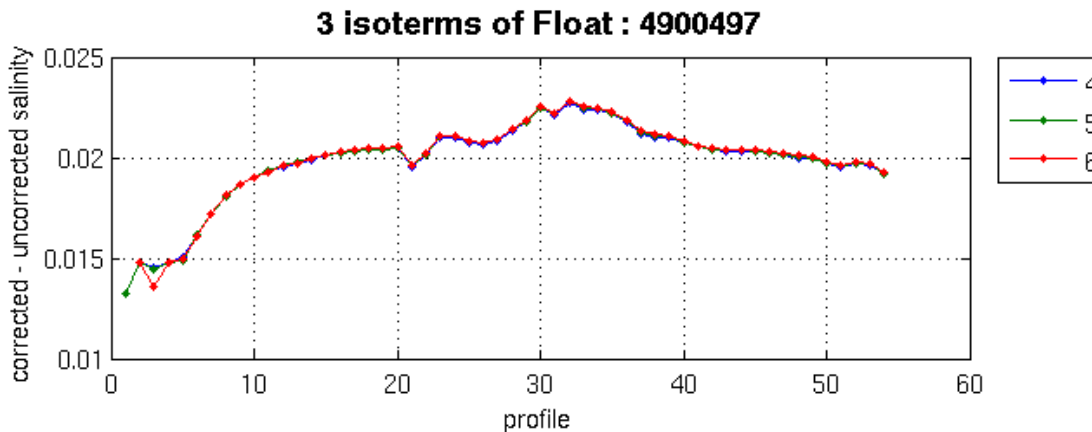

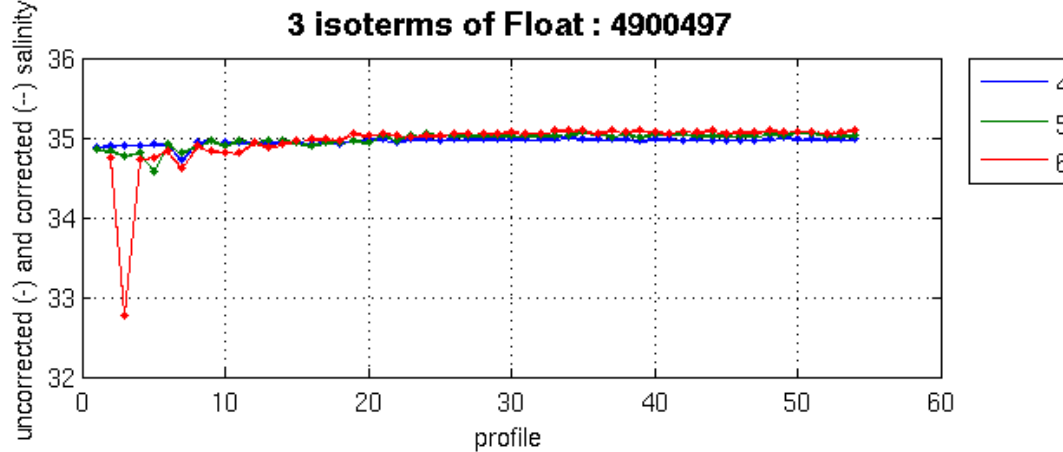

Meds correction

3)

This float has been corrected (red curve), but the Boehme&Send (2005) method proposes a different correction (blue or black curves), consistent with the residuals deduced from the objective analysis.

Case 2 : suspicious offset

2006

In all cases, the Boehme&Send method suggest a correction of order 0.02 psu or more.

Case 2 : suspicious profilers

- Given the fact that 5 or 6 profilers show the same offset of order 0.02 psu, it is likely that the measurements are true.
- Those floats are from MEDS and we don't know yet how MEDS corrected these floats. Hypothesis are :
 - they may have used neighboring ARGO floats and data from the Bedford cruises in the reference database, they also use Wong et al.'s software
 - both the reference database and the software are different at Coriolis
- So, knowing the current conditions near Newfoundland, we are able not to correct good profiles but we are not able to correct profiles that need a correction....

Conclusions On ARGO Dataset consistency

- We were among the first users of the delayed mode data: some problems in the D files have been identified and resolved
- From those first analyses, general statistics show that the delayed mode dataset in the North-Atlantic is rather good
- Few “bad” profiles with a $0 < QC < 3$ have been found
 - very low percentage of the delayed-mode profiles
 - the analysis system allow to detect them in a rather efficient way
- The analysis is able to detect “suspicious” profilers. They will be “reconsidered” by they PI and operator. DM data with a $QC=2$ will be consider with greater attention.
- This study reveals the importance of the reference database (and of the software ?) to propose the adequate correction.

Perspectives On ARGO Dataset consistency

More work is necessary

- to fully understand and exploit the results of the analyses
- to adapt the analysis system to the consistency problem in
 - improving the initial climatology to eliminate bias due to the age of the climatology
 - increasing the number of neighboring floats in each analysis to reduce the weight of 1 float compared to the other
- to transfer/adapt the method for an operational use

- Take advantage of a dataset (Coriolis FTP files):
 - homogeneous (format and QC)
 - Extended (ARGO profilers, CTD/XBT, buoys and moorings)

- Use an operational tool (Coriolis Analysis System)
 - Codes adapted to Coriolis datasets
 - Configuration (grid, statistics, reference climatology)
 - Tunable parameters

- To Perform the re-analysis of the ARGO period (2000-2005)

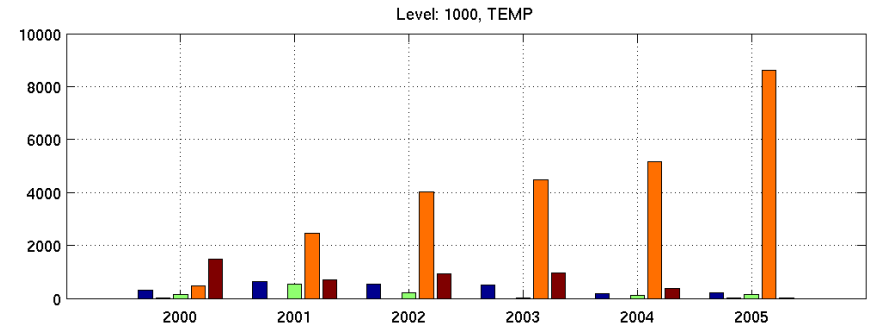

Dataset 2000-2005

- Download of Coriolis data base: 23/01/2006
- Use $0 < QC < 3$
- High frequency data averaged (over 1 day)

The ARGO array has been gradually setting up:

- Very poor in 2000
- Temperature improved in 2001
- Salinity in late 2002
- Nearly nominal since mid 2003

Most data are now provided by ARGO

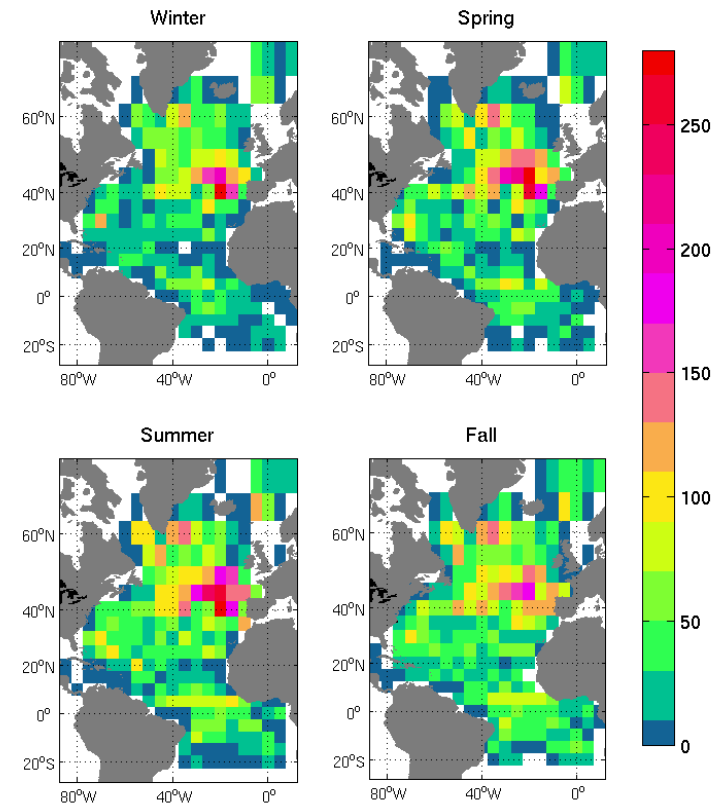

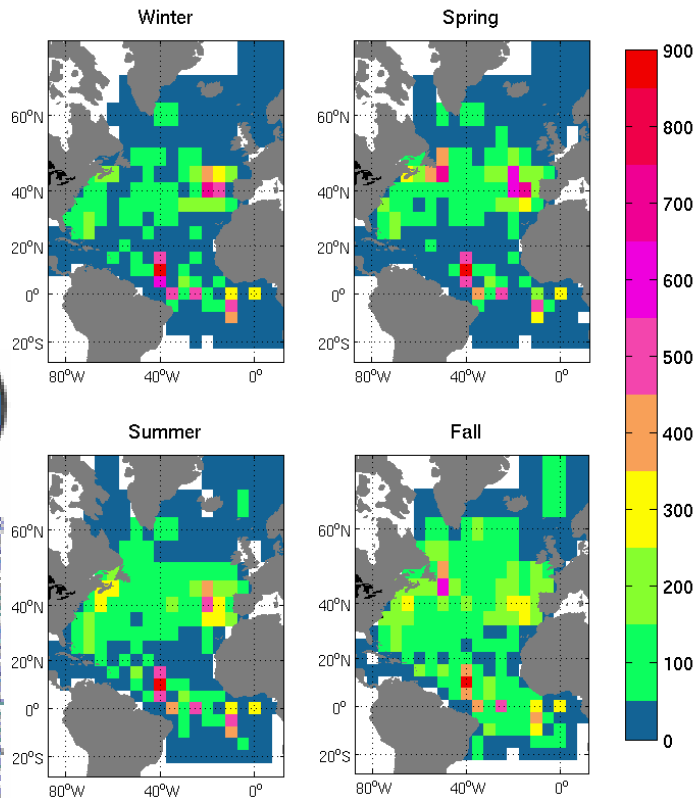

Data distribution over space

- The Atlantic from 20S to 70N is not evenly sampled : The 20N and 20S bands and latitudes > 65N are less observed (except for Norwegian sea)
- The seasonal bias is moderate
- North-East Atlantic is the best sampled area

Conclusion on Climatology activity

■ Coriolis dataset

- Since 2003 the full 0-2000m layer is well covered for T and S by ARGO profilers
- High latitude and shelves remain problematic

■ Mean 2000-2005 /WOA01-v2

- Surface : water is warmer and saltier (except 10°N fresher)
- At 400 m : Gulf Stream and North Atlantic Current are cooler and fresher (at least in the western basin). Labrador sea is fresher. NE Atlantic is warmer and saltier.
- At 1000/1400 m: Labrador sea is warmer and fresher. Eastern basin is Warmer and saltier. Central (40N-40W) basin is colder and fresher. Tropics are warmer and mostly fresher

■ 2000-2005 inter-annual variability at basin scale can be accessed with this dataset
