

# STATISTIQUE DES REGIONS DE PECHE

ANNEE 1950 ET 1951

(1er et 2e semestre)

*(En exécution des Conventions Internationales)*

Pour les années précédentes : se reporter à la collection, des *Notes et Rapports de l'Office des Pêches Maritimes*. Vol. N° 43 - 46 - 51 - 52 et aux Fascicules 1 et 3 des Tomes I, II, III, IV, V, VI, VII, VIII, IX ; Fasc. 1 et 4, Tome X. 1-2 et 4 Tome XI. 1-4 Tome XIII. Tome XV et Tome XVI de la *Revue des Travaux de l'Office*.

---

## NOTICE

Le Conseil International des Pêcheries de l'Amérique du Nord (Canada, Etats-Unis, France et Terre-Neuve), dans un désir d'unification des méthodes de collation des statistiques, a décidé d'appliquer à la côte orientale du continent américain une nomenclature des régions de pêche faisant suite à celle adoptée déjà par le Conseil International pour l'Exploitation de la Mer (Europe).

Les secteurs suivants ont été délimités :

- XIV. — Côte orientale du Groënland ;
- XV. — Côte occidentale du Groënland ;
- XVI. — Baie d'Hudson ;
- XVII. — Côte du Labrador ;
- XVIII. — Côte orientale de Terre-Neuve ;
- XIX. — Golfe de Saint-Laurent ;
- XX. — Bancs de Terre-Neuve ;
- XXI. — Bancs de la Nouvelle-Ecosse ;
- XXII. — Bancs de la Nouvelle-Angleterre ;
- XXIII. — Côtes atlantiques des États du Centre ;
- XXIV. — Côtes atlantiques des États du Sud ;
- XXV. — Golfe du Mexique ;
- XXVI. — Iles Bermudes ;
- XXVII. — Grandes Antilles et Iles Bahamas ;
- XXVIII. — Petites Antilles.

La conséquence de cette répartition est que le secteur désigné jusqu'ici sous le n° XIV, dans les statistiques des régions de pêches déjà publiées dans la *Revue des Travaux de l'Office*, prend dans la nouvelle nomenclature les n°s XX et XXI (1). La côte occidentale du Groënland, fréquentée par les pêcheurs français, est portée sous le n° XV.

Dans ces statistiques rentrent sous la dénomination « sardine » : les immatures de l'espèce « *Clupea pilchardus* » (sardines dites de « rogue »), ainsi que les adultes : sardines dites « de dérive », « sardines coureuses », « Célans » ou « Pilchards ».

Les statistiques françaises évaluent ordinairement les quantités de sardines débarquées dans certains ports de pêche en *milles*.

Cette évaluation manque de précision, car le poids de la sardine capturée dépend de l'âge et de la taille de ce clupéidé, facteurs variables suivant l'année, l'époque de l'année et le secteur de pêche.

Dans la statistique présentée, les quantités pêchées ont été évaluées en *kg* et établies d'après les données suivantes basées sur des observations précises poursuivies pendant de nombreuses années.

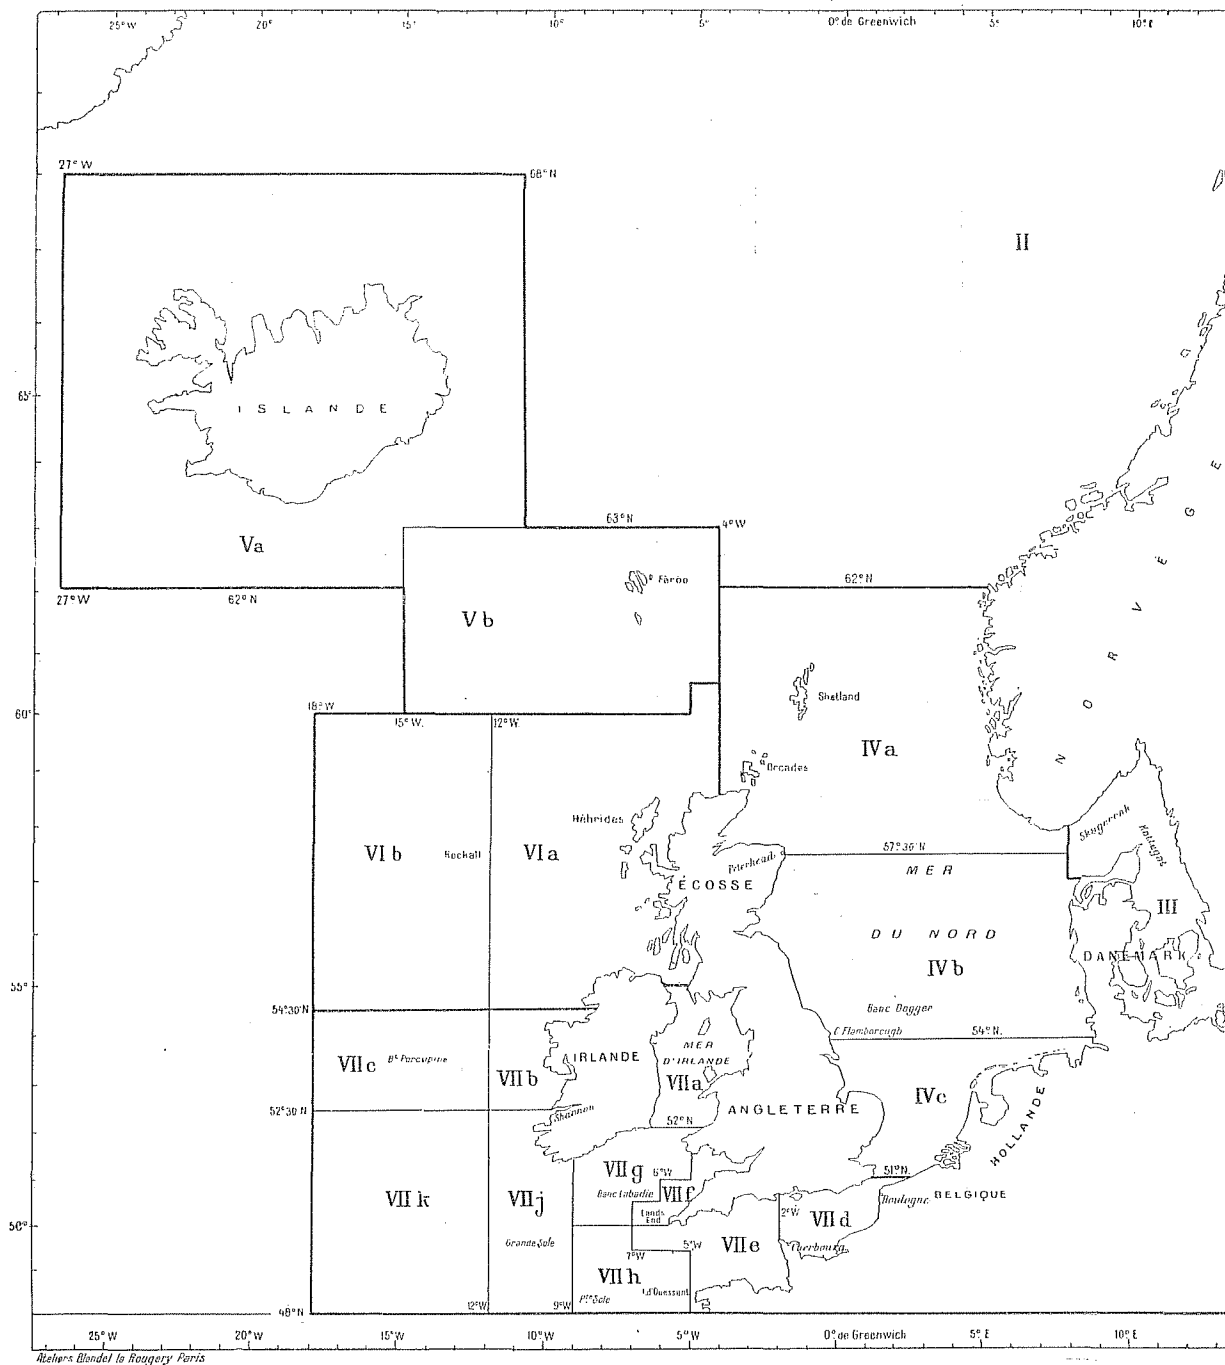

|                 |                                |        |
|-----------------|--------------------------------|--------|
| Secteur VII d.  | poids moyen du mille . . . . . | 50 kg. |
| Secteur VII e.  | »                              | 40 »   |
| Secteur VII h.  | »                              | 30 »   |
| Secteur VIII a. | »                              | 25 »   |
| Secteur VIII b. | »                              | 20 »   |
| Méditerranée    | »                              | 20 »   |

Suivant les années, ces chiffres peuvent être différents et, le cas échéant, mention en sera faite dans les statistiques.

(1) Les données statistiques concernant les captures dans ces deux secteurs seront groupées dans une colonne unique portant le numéro XX et XXI, car il est actuellement impossible d'obtenir des capitaines de Terre-Neuve une exacte provenance de leurs prises sur l'étendue des bancs.
