

**WebPanel 1. Materials and methods****Sampling**

Although multiple seafood products were often purchased in a single store (especially large supermarkets), these were restricted to goods that were likely to have distinct supply chains (eg different brands, frozen or fresh, pre-packaged versus over-the-counter, smoked or fresh, etc). Additionally, in products containing multiple items, or fillets, only a single sample was collected and analyzed to ensure the independence of data collected. Either products were taken back to the laboratory to be stored at  $-20^{\circ}\text{C}$  on the day of purchase, or a small piece of tissue was removed and preserved in absolute ethanol. Packaging was retained or photographed, and the label information was recorded.

**Laboratory analyses**

Each of the laboratories involved in the project has considerable experience in the analysis of seafood products and molecular barcoding and taxonomy. Multiple ring trials were conducted throughout the study, as part of the LABELFISH project ([www.labelfish.eu](http://www.labelfish.eu)) to ensure consistency, robustness, and accuracy in the identification process. All data used in this study were generated by isolating DNA from tissue using commercial kits (eg Promega Wizard DNA, Qiagen DNeasy, Invitrogen “ChargeSwitch”) and then applying one of the following DNA sequencing approaches.

For fresh and frozen unprocessed seafood products, DNA was amplified targeting either the  $\sim 464$  base pair (bp) fragment of the cytochrome-*b* (*cyt-b*) mitochondrial gene with primers H15149ad and L14735 (Kocher *et al.* 1989), or the  $\sim 650$  bp “DNA barcode” fragment of the cytochrome *c* oxidase I (COI) mitochondrial gene with primers FishF2 and FishR2 (Ward *et al.* 2005).

For degraded DNA – typical of highly processed seafood such as tuna and anchovy canned products – smaller diagnostic *cyt-b* fragments were chosen. For anchovies, a 100 bp fragment was amplified, using primers C-CB284dF and C-CB425dR, following Jérôme *et al.* (2003); for tunas, the patented CSIC BDR primers (Mackie *et al.* 1999) were used to generate a 187 bp amplicon. At the IFREMER lab in France, additional markers were used for tuna, based on the mitochondrial control region (primers L15998, DLtun238, and DLtun360 in Viñas and Tudela [2009]), and for gadoids, using the mitochondrial internal spacer (IS) region using primers L15598 and H15666 (Bakke *et al.* 1999).

All products were Sanger sequenced using European commercial services, including Beckman-Coulter (Essex, UK), Biopremier (Lisbon, Portugal), Genoscreen (Lille, France), and LGC Genomics (Berlin, Germany). All the sequences were uploaded in GenBank with accession numbers between KJ510424–KJ531384 and KJ563141–KJ645864, and with COI sequences organized in the LABELFISH COI code: ELSII on the Barcode of Life Data Systems (BOLD) database ([www.boldsystems.org](http://www.boldsystems.org)).

Edited DNA sequences were then matched to well-established international sequence databases. COI barcodes were identified using the BOLD database ([www.boldsystems.org](http://www.boldsystems.org)), whereas *cyt-b*, control region, and IS sequences were matched against Genbank ([www.ncbi.nlm.nih.gov/genbank](http://www.ncbi.nlm.nih.gov/genbank)) using the nucleotide BLAST (Basic Local Alignment Search Tool) online function, as well as using verified voucher sequences stored at CSIC, Vigo, Spain, and Max-Rubner Institute, Hamburg, Germany. Across all laboratories, species were identified using a 99% minimum sequence identity criterion, with the exception of yellowfin (*Thunnus albacares*) and bigeye (*Thunnus obesus*) tunas, where the threshold was strictly 100% (Viñas and Tudela 2009).
