

Supplementary Table 1. Average copper, ligand and speciation data across all stations for each month sampled, with range beneath in italics. Sal: salinity; Cu<sub>d</sub>: dissolved copper, HS<sub>Cu</sub>: copper-binding humics; thiols (nM thiourea equivalent), L<sub>1</sub>, L<sub>2</sub>, log K'CuL<sub>1</sub> and K'CuL<sub>2</sub>, the calculated concentration of free Cu<sup>2+</sup> and the percentage of copper bound as CuL<sub>1</sub> and CuL<sub>2</sub>. CuL<sub>1</sub> was found to correspond with thiol-bound copper at most stations and therefore occurs primarily as monovalent copper (Cu(I)); CuL<sub>2</sub> is predominantly copper bound to humic substances therefore occurs as divalent copper (Cu(II)).
