Abstract :

We provide a cartography of the current property regimes of permanent coastal lagoons along the coastlines of the Mediterranean Sea for continental France and Corsica, which include both private and public properties. In France, for the latter, the State Domain Code and the General Code of the property of public persons make a clear difference between Public Domain and private property of the different public entities. Public domain represents property that is imprescriptible and inalienable, i.e. the property rights cannot be changed in the future and neither transferred nor sold to somebody else. In contrast, private properties of public entities can be sold or transferred to thirds. Maritime Public Domain (DPM) was created since 1681. DPM has accommodated Public Domain for the French coastal lagoons following their legal definition as “salty ponds (French étangs salés) with a direct, natural and permanent connection with the sea”. However, private landlords battled juridically with the State for centuries both by attacking the pertinence of this definition and claiming ancestral property rights. As a result, before 1980, more than half of the coastal lagoons comprised private properties, representing about a quarter of the lagoon surface. Twelve of 40 coastal lagoons comprise DPM, mainly the larger lagoons (e.g., Salses-Leucate, many lagoons close to Narbonne, Thau lagoon, Berre lagoon), representing 65% of the total lagoon surface. Since its foundation in 1975, the Conservatoire du Littoral, a public body in charge of coastal nature protection, has bought private coastal lagoons properties in twenty of 40 lagoons, representing 22% of the total lagoon surface. These have been designated as inalienable and imprescriptible “Public Domain of the Conservatoire”, safeguarded for nature conservation purposes. Nowadays, private ownership still persists in 13 lagoons representing 3.3% of total surface. The Coastal lagoons in Roussillon (Etangs du Canet and Salses-Leucate), the Hérault department, in the Camargue and in Corsica currently show variable and sometimes fragmented ownership (in addition to the Conservatoire, DPM, private ownership, municipalities, departments). Fragmented ownership is a clear difficulty for the integrated management of coastal lagoons. With currently, 87% of the coastal lagoons as Public Domain, public law and the environmental code have to evolve to tackle the challenges for the conservation and management of coastal lagoons and their connectivity with the other ecosystems on land and in the sea.

Graphical abstract

Highlights

► Today 87% of the surface of the Mediterranean lagoons in France is public domain. ► It comprises DPM (65%) and domain of the Conservatoire du littoral (22%). ► Variability and changes of property regimes reflect a historic process. ► Still existing fragmented ownership jeopardizes integrated management.

Keywords : Property regimes, Coastal lagoons, Maritime public domain, Commons, Nature conservation, Governance, Coastal law, Marine protected areas

Introduction

In many countries, e.g. France, Spain, Portugal, Greece, Turkey and several states in the USA, the national coastal seas and the coastlines are public properties often legally owned by these national States. This can be considered as a legacy of the public domain defined by Roman Law (Fenn Jr, 1925). Such property regimes are important both for defining who will have access to these ecosystems, rights for natural resource extraction (Schlager and Orstrom, 1992) and other human uses. The public domain is open for use by the citizens of these states. It is, however, clear that in many cases the second principle of Hugo Grotius, i.e., anything can be used without loss to anyone else is often not applicable in the coastal lagoons, which are therefore not fully a space *res omnium communis* (Thompson, 2005). Rather the uses need to be regulated by Government or by the local communities as in Community-based management (Berkes, 2006). Coastal lagoons have been used by coastal populations since prehistoric times. Traditional uses include fishing, hunting, navigation and salt-extraction (Anthony et al. 2009; De Wit et al., 2019). More recently, particularly since the 19th century, aquaculture, tourism and recreational uses have become increasingly common in coastal lagoons. Finally, there is increasing awareness of the need for protecting the coastal biodiversity, particularly by creating protected areas for the conservation of habitats and species. Coastal lagoons represent a so-called priority habitat (N° 1150 *) according the EU Habitats Directive (1992), meaning that member states should protect the coastal lagoons and assure their conservation status (De Wit et al., 2020). The Convention on Biological Diversity (CBD) recognizes sovereign rights over biodiversity within national territories (Thompson, 2005), which include the coastal zones. Hence, property regimes in coastal lagoons have to be considered for implementing biodiversity conservation in these ecosystems.

Coastlines are transient both on short-term and long-term timescales, as sea level elevation varies along astronomic and meteorological cycles and land may accrete or erode. This creates difficulties in delineating the public property along the coastline (Yavuz Özalp and Akıncı, 2016) with sometimes subtly different approaches within the same State (McGlashan et al., 2005). In addition, the delineation can be further confused by the presence of transient environments. In this paper, we study the property regimes of the Mediterranean coastal lagoons in S. France. In this country, many of the coastal

lagoons, but not all, belong to the maritime public domain (In French: *Domaine Publique Maritime*, abbreviated as DPM). This is based on the French law on the Public Maritime Domain (28 November 1963) and article 2111-4 of the French General Code of the property of public persons (*Code général de la propriété des personnes publiques*, see website), which states that the DPM includes (ii) the floor and below-floor earth layers of those “saline ponds” that communicate, in a natural way, permanently with the sea. In the official French text, the article uses the term “*étangs salés*”; *étang* translates as pond or pool (Harrap’s dictionary), while it is used in vernacular language for the coastal lagoons in South France and used for the official geographic names, as e.g. Etang de Vic. The wording of the French legal text may thus create a conflict with the scientific definition of a coastal lagoon. according the most commonly accepted definition in coastal sciences, coastal lagoons are described as “*inland water bodies, found on all continents, usually oriented parallel to the coast, separated from the ocean by a barrier, connected to the ocean by one or more restricted inlets which remain open at least intermittently, and have water depths which seldom exceed a few meters*” (Kjerfve, 1994).

The aim of this paper is to document the current property regimes in French Mediterranean coastal lagoons and discuss their implications for the management of these coastal ecosystems, with a particular focus on nature conservation, natural resource extraction and other human uses. In addition, the aim is to understand the genesis of the current situation, particularly the existence of the private ownership and, therefore, two hypotheses can be forwarded for explaining private properties of coastal lagoons, i.e.,

H1: The private property existed in the past before the DPM was implemented and has been passed through inheritance,

H2: The legal text is not sufficiently precise to include all types of coastal lagoons and this has favoured the takeover of properties by private persons or institutions.

Finally, we will discuss the actions to be taken to improve the current situation, particularly with respect to conservation of coastal lagoons.

2. Study site and methods

2.1 Study sites

Study sites include the permanent coastal lagoons along the Mediterranean coastlines of continental France and the island of Corsica. These coastal lagoons occur in three administrative Regions, i.e., i) Occitanie (littoral zone of the Gulf of Lion, where they occur along 50 % of the coastline), ii) Provence-Alpes-Côte d'Azur and iii) Corsica (littoral of the Tyrrhenian Sea). In French *étangs littoraux* is the generic name for coastal lagoons, and the word *Étang*, used in their official geographic names, is abbreviated hereafter as Et. (e.g., Etang de Vic written as Et. de Vic). Coastal lagoons are separated from the sea by a coastal barrier and have permanent or temporary connections with the adjacent sea through one or several inlets (Kjerve, 1994). Nowadays in most of the French Mediterranean lagoons the inlets have been modified by humans to assure a permanent connection with the sea. Naturally-moving inlets still occur for the Etangs de La Palme and Ayrolle in Occitanie, and several lagoons in Corsica. Several of the coastal lagoons in deltaic settings have been separated by several km's from the sea by progression of the delta, while still connecting with the sea through wetlands or artificial canals.

The lagoons close to Montpellier have been heavily modified. Originally, the Etang de Mergueil was a large lagoon that ranged from Frontignan (close to Etang de Thau) in the SW up to the Camargue in the NE. This lagoon has been compartmentalized by canals, dikes and roads into 10 different 'étangs', i.e. the larger Etang de l'Or and a complex of nine water bodies designated as the Palavas Lagoon Complex (in French Complexe lagunaire palavasien). Only two of these water bodies (Et. d'Ingril Sud, Et. du Prévost) have an inlet connecting directly to the Mediterranean Sea. The building of the Rhône-to-Sète canal, which started in the 18th century, has separated four permanent lagoons (Etangs de l'Ingil Nord, de Vic, de l'Arnel, and du Méjean) from the coastline and exchanges of these lagoons with the sea occur through this canal. Etangs de Pierre Blanche and le Grec are located on the coastline and separated from the sea by a barrier without an inlet; these two lagoons also exchange with the sea through the Rhône-to-Sète canal.

2.2 Methods

French legal text and historical documents were studied to describe the specificities of current French law and the chronology of its implementation. Most of the French text is now available on-line on internet at the website Légifrance (<https://www.legifrance.gouv.fr>) and the pertinent sections are mentioned in the reference list.

The cartography was based on using Q-GIS (version La Palma 2.18.15). Shapefiles for coastal lagoons were obtained from the Data bases Ocsol in Occitanie and PACA and CORINE land cover for Corsica (CLC 521). Shapefiles for cadastral parcels and municipalities for coastal lagoons were obtained from the French national geographic institution (IGN). Openstreet maps were used as a plug-in. Information of properties regimes were obtained from documents, the website for the *Conservatoire du littoral*, the website of the *Direction départementale des territoires et de la mer* (DDTM), and interviews with coastal zone managers.

Timeline

Figure 1: Timeline listing the most important legislation and historic events that have important implications for property regimes in coastal lagoons.

3. Results

3.1 Analyses of the chronology of laws and jurisprudence in France related to property rights of coastal lagoons

Figure 1 lists the most important legislation and historic events that have important implications for property regimes in coastal lagoons. The Edict of Moulins was signed in 1566 by King Charles IX, with the aim to clarify a distinction in the Kingdom of France for the Royal property of the King (*Domaine Royal*) between the properties at his disposal for private issues (*Domaine casuel*) and the property that was eternally associated to the kingdom (*Domaine fixe*), i.e. the King should legate the *Domaine fixe* to his successor. For the latter property, the Edict introduced the characteristics of inalienability and imprescriptibly meaning, respectively, that its property rights cannot be changed in the future and neither transferred nor sold to somebody else, and that the inalienability is exempt from subscription. Today, the current State Domain Code and the French General Code of the property of public persons (*Code général de la propriété des personnes publiques*, CGPPP) inherited this difference, as for public property it differentiates between “*Domaine Public*” and “*Domaine Privé*” (L.3111-1 of the CGPPP) in analogy to the former “*Domaine fixe*” and “*Domaine casuel*”, respectively. Hence, the *Domaine Privé de l’Etat* (DPE) translates as “private property of the State”, which in English is an oxymora as private property is opposed to public property. The different forms of public domain are subjected to inalienability and imprescriptibly, while the “private property of the State” (DPE) is not and can be sold to third parties.

More than a century later (1681), the Colbert ordinance of the Navy introduced the Natural Maritime Domain (*Domaine Public Maritime*, abbreviated DPM) stating that DPM “shall be considered as the edge and shore of the sea including all that the tide covers and uncovers during the new and full moons and how far the biggest wave of March can reach on the beach”. Because the original ordinance only mentioned the shores of the sea it left the issue of the coastal lagoons unsettled. The issue of how to accommodate the DPM for coastal lagoons was settled in the following centuries. Today, the DPM comprises the artificial DPM (harbours, sea-defense structures, navigation channels, etc.) and the natural DPM (Domain Public Maritime naturel). Table 1 gives the legal text

in French for the natural DPM and its translation in English. The second point, i.e. *des étangs salés*, clearly refers to coastal lagoons.

Table 1: Definition of the natural Maritime Public Domain according French General Code of the property of public persons (*Code général de la propriété des personnes publiques*, CGPPP) in French (left column), and its translation by the authors in English (right column).

Le DPM naturel est inaliénable et constitué :	In France the natural Maritime Public Domain is inalienable and encompasses:
1- du sol et du sous-sol de la mer, compris entre la limite haute du rivage (c'est-à-dire celle des plus hautes mers), et la limite, côté large, de la mer territoriale ;	1- the seafloor and its subsurface strata between the upper level of the shoreline (i.e. those of the highest tides), and the limit of the territorial sea);
<u>2- des étangs salés en communication directe, naturelle et permanente avec la mer ;</u>	<u>2- the “salty ponds” (<i>étangs salés</i>) = coastal lagoons with a direct, natural and permanent communication with the sea;</u>
3- des lais et relais de la mer.	3- sediment deposits of the sea along the coastline.

The DPM definition of the *étangs salés* (Table 1) raises many problems for considering the entire range of environmental conditions for coastal lagoons and creates conflicts with the aforementioned scientific definition of coastal lagoons by Kjerfve (1994).

During the 19th century, many ambiguities were solved by the jurisprudence of the Criminal Chamber of the Cassation Court. Hence, in 1848 the judgement stipulated that coastal lagoons that do not have an inlet, but communicate with the sea only through a man-made canal do not belong to the natural DPM (Cuënot et al., 1851). *Etang salé* suggest that salinity should be similar to the adjacent sea (i.e. a salinity of about 35 in the adjacent Gulf of Lion) and raises the question of whether mesohaline (salinity between 5 and 18) and oligohaline coastal lagoons (salinity lower than 5) could be included in the natural DPM? However, salinity measurements were not yet commonly used in the 19th century. While a first judgment in 1842 first specified that the lagoon

should be home to the same fish species as in the adjacent sea, later this was rectified by a judgment in 1861 stipulating that the lagoon may also hold a mixture of freshwater and seawater species. This allowed to include many of the meso- and oligohaline coastal lagoons in the DPM. Finally, a judgment in 1860 stipulated that the inlet maybe temporarily closed. An example is the Etang de la Palme, where the inlet completely closes off every year (Larue and Roquet, 2016). Finally, while astronomic and meteorological tides have been taken into account since the Navy ordonnance of Colbert, more precise procedures for delimitation of the DPM were introduced in 1973 by a judgment (arrêt) of the Conseil d'Etat (the Kreitmann case-law).

While, these abovementioned Court trials focused on challenging the definition of the DPM itself, claims of private ownership of coastal lagoons have also been based on invoking pre-existing private property rights. Hence, jurisprudence followed by its inclusion in law, fixed the date of retroactivity of the DPM at 1566, the year of the Edict of Moulins. This means that public domains cannot be retroactively enforced prior to the Edict of Moulins (Torquebiau, 1965) implying that all private and Church properties existing before 1566 were to be respected and could thus not be included in the DPM. Therefore, the Royal and the Navy's administrations, under the Old Regime period and the Second Empire, respectively, carried out an inventory and put into place restitution procedures for rights prior to the Edict of Moulins (Feral, 2000). Numerous documents were produced by families from Languedoc and Camargue, attesting to ownership by their ancestors before 1566 of coastal lagoons (*étangs salés*) and other water bodies, as canals etc., as well as fisheries and *maniguières*. The latter are fishing rights linked to the land ownership of the coastal lagoons (Feral, 2020). The Minister of the Navy, in a decision of 30 July 1964, drew up a list recognising a large number of private owners of coastal lagoons and canals in the French Mediterranean (about 200 private owners of *coastal lagoons*, canals, fisheries, islets, rivers, streams etc.). In Roussillon (Pyrénées orientales Department), Et. De Canet and a small part of the Salses-Leucate Lagoon (Anse de la Roquette) were recognized as private property on the basis of Spanish titles after 1566 but before the Treaty of the Pyrenees of 1659 (Feral, 2020). Remarkably, in Corsica, annexed by France in 1768 and part of the Republic of Genova before, the seven coastal lagoons remained private property until quite recently.

Private ownership was not always accepted by all sectors in society, as there have been many conflictual cases between the administration and private owners of coastal lagoons, first in front the civil courts (Torquebiau, 1965) and later in front of the administrative courts. The Navy administrations and coastal lagoon fishers organized in corporatist and professional organizations, the *Prud'homies de Pêche* (Féral, 1978; Féral, 1987), defended the idea of the coastal lagoon as a natural public domain for guaranteeing freedom of fishing. This resulted in an arm wrestling's with landlords (Hostiou, 1990; Féral, 2020a), who often claimed the exclusive private ownership of coastal lagoons with their rights to prohibit access and fishing by others. As shown before several procedures rehabilitated private property of coastal lagoons on the shores of the Mediterranean, even though their objective geographical location and hydrological features qualifies them to be part of the DPM. In this respect, a last notable case concerned the Et. de Vic opposing the fishers of Palavas and the Société des Salins de Villeneuve. The Trial (T.G.I. Montpellier, 26th June of 1964) decided to recognise private ownership and fishing rights based on an arbitration award by the *Prévost de Maguelonne* dating to 8 September 1190, which was taken up by a Judgment of the Parliament of Toulouse in 1617 and, therefore, prior to the Edict of Moulin of 1566 (Féral, in press). In addition, on the particular occasion of the French revolution in 1789, some Church and state property has been sold to private owners (*vente des biens nationaux*). Altogether, this explains why a large part of the coastal lagoon surface was private property before 1980.

The *Conservatoire de l'espace littoral et des rivages lacustres*, known as the *Conservatoire du littoral* was created to prevent the destruction of natural habitats by the galloping urban and touristic developments. Enforced by Law (Law for the creation of the Conservatoire du Littoral, 1975) the *Conservatoire du Littoral*, hereafter referred to as the *Conservatoire*, is a public institution that has the prime mandate to safeguard natural areas along the coast. Therefore, it has acquired properties along the coast mainly by buying it from private owners. Occasionally, it hasq also used expropriation procedures and benefited from bequest. Upon acquisition, the property is formally private property of the Conservatoire, but normally within a year the property is shifted to the Public Domain as '*Domain Public du Conservatoire*', which means that it has become imprescriptible and inalienable. Hence, its prime objective as a protected natural area

cannot be changed and this is exempt from subscription. Later appeared the Nature Conservation Law in 1976, the Coastal Law (1986) and the EU Habitats directive in 1992, transposed in French law since 1995 by *Loi n° 95-101*, EU Habitats Directive, transposition into French Law (1995) and the Biodiversity Law (2016). Coastal lagoons are a priority habitat (i.e., N° 1150 *) in the EU Habitats directive (1992). On 1 December 1986, France also ratified the Convention on Wetlands of International Importance especially as Waterfowl Habitat (1971), known as the Ramsar Convention.

By law (Law for the creation of the Conservatoire du Littoral, 1975), the management of the Public Domain of the *Conservatoire* is delegated to local partners. When seeking partnerships for this management, the *Conservatoire* invites local municipalities in the first place. Other decentralized public institutions, as Departments and Régions, as well as NGO's can also act as managers. These local partners establish a master plan for the management in collaboration with the *Conservatoire*, who has to give his final approval. In contrast, the natural DPM is nowadays managed by the Direction Départementale des Territoires et de la Mer (DDTM), which is a service of the French State that has a branch in all coastal Departments. Human uses, e.g., shellfish farming, salt extraction and touristic infrastructure are allowed on a temporal basis only through concession contracts. Fisheries has been traditionally regulated by a type of community-based ecosystem management through the *Prud'homies de Pêche* (Féral, 1978, Féral, 1987).

3.2 Cartography of property regimes in French Mediterranean coastal lagoons

Starting at the Spanish-French border in Occitanie, following the coastline clockwise and ending in Corsica, Figures 2, 3, 4, and 5 successively depict the cartography of property regimes and Table 2 provides quantitative data for the French Mediterranean coastal lagoons. The Etang de Canet, in the Roussillon region (Pyrénées orientales Department), which in principle qualifies well for the DPM, was private property, of which most has now been acquired by the *Conservatoire*. Thau lagoon, and almost all lagoons in the Aude Department are DPM (Fig. 2). However, as described before one smaller cadastral parcels, the Anse de la Roquette (44.9 ha) in the SW part of Etang Salses-Leucate, excluded from the DPM is private property. Moreover, in Etang Bages-Sigean there is another anomaly as one cadastral parcel in the SW is owned by the Aude Department. Some smaller lagoons in Figure 2, are either owned entirely by the *Conservatoire*

(Bagnas) or shared among private property and the *Conservatoire* (Vendres, Pissevaches).

The lagoons close to Montpellier (Fig. 3) show a remarkable patchwork of property regimes. Only Etang D'Ingril Sud, Etang de l'Or and a small section of Etang de Méjean are DPM. Three of the four lagoons that have been separated from the coastline by the building of the Rhône-to-Sète canal (see 2.1 Study sites) are either largely (Et. d'Ingril Nord, Et. d'Arnel) or for a small part (Et. Méjean) private property of the State (DPE). The abandoned Salinas in Et. d'Ingril have been acquired by the *Conservatoire*. The municipality of Lattes owns about half of the Et. de Méjean, a small part of this lagoon along the NE shoreline is also private property. Etang de Vic and most of Etang Pierre Blanche are Public Domain of the *Conservatoire*, who acquired most of this by acquisition from private owners, while some cadastral parcels were transferred from the private State domain (DPE) to the *Conservatoire*. The municipality of Villeneuve-lès-Maguelone owns cadastral sectors in the Et. Pierre blanche and Et. de Prévost. The rest of the latter lagoon is private property (propriety of the diocese of Montpellier and managed by the '*Compagnons de Maguelone*', an NGO in charge of maintaining the heritage of the Romanesque cathedral de Maguelone and engaged in social programmes). The Et. le Grec is entirely private property, which is based on the abovementioned 1848 judgment by the Cassation Court (Cuënot et al., 1851). The canal Rhône-to-Sète is *Domaine Public Fluvial*, which is managed by *Voies Navigables de France* (VNF).

None of the lagoons in the Camargue are DPM (Fig. 4A). In the Camargue of the Gard Department, the Etangs Charnier, Grey and Scamandre are owned by the local municipalities (Vauvert and Saint-Gilles). In the Bouche du Rhône Department, the *Conservatoire* has acquired more than 94 % of the surface of Et. de Vaccares, while some smaller private properties still remain along the W., N., and E. shorelines. The four lagoons in the SE corner of the map in Fig. 4A all belong nowadays to the *Conservatoire*. Before 2009, these lagoons were privately owned by the Groupe Salins company and managed as salt preconcentration ponds for a major salt work in Salin de Giraud (De Wit et al. 2019). Since their acquisition by the *Conservatoire*, the management has changed and the lagoons are nowadays managed for nature conservation purposes. Close to

Marseille (Fig. 4B), the Etang de Berre, the largest French Mediterranean lagoon (156 km²), is DPM with the particularity that its surface is not attributed to any municipality. The adjacent Et. de Bolmon has been acquired by the *Conservatoire*. Finally, in the Var Department, the Et. de Villepey (Fig. 5C) is also owned by the *Conservatoire*.

In Corsica, none of the seven coastal lagoons are DPM (Fig. 5). All these coastal lagoons were private properties until quite recently. The Department 'Haute Corse' acquired in 1994 the property of the largest lagoon in Corsica, i.e. Et. de Biguglia. Concerning the other six lagoons, two are still entirely privately owned (Et. de la Diana, Et. de la Ballistra), while others have been fully (Et. d'Urbino, Et. Santa Gulia, Et de Palu) or partially (Et. de Terrenzana) acquired by the *Conservatoire* and became *Domaine Public du Conservatoire*.

Table 2: Forty coastal lagoons in S. France and Corsica (Regions Occitanie, Province-Alpes-Côte d'Azur, Corse) listing their surfaces (ha.) from land cover data bases (equivalent to Corine Land Cover class 521, see Methods), mean depths and surfaces (in ha.) for the different classes of property regimes, and number of municipalities and Departments involved. Most water depths obtained from Le Fur et al., 2018).

Geographic name of lagoon	Surface ¹⁾ (ha)	mean depth	DPM surface (ha)	State property		DPE surface (ha)	Department (CD) surface (ha)	Municipality surface (ha)	Private surface (ha)	N° of municipalities	N° of Departments

- 1) Negotiations for the acquisition of cadastral parcels in Et. Balistra by the *Conservatoire* have started since 2015.
- 2) Note that the sum of cadastral parcels is slightly above 100 % of total lagoon surface because the shorelines for the coastal lagoons often do not fit to the cadastral boundaries.

Table 2 resumes the information in a quantitative way. The total lagoon surface is about 577 km². DPM occurs in twelve of the 40 lagoons, either the lagoon is partially DPM (e.g., Et. Salses-Leucate, Et. Bages-Sigean, Et. de Méjean) or entirely DPM (Et. de Thau, Et. de Berre). Despite the fact that this is a minority of lagoons, DPM represents almost 65 % of the total lagoon surface as it includes all the larger lagoons. Private state property of the (DPE) only covers 1.3 %. Recently, 137.7 ha of private state property (DPE) in the Palavas lagoon complex (cf. Fig. 3) has been retroceded to the *Conservatoire*. Properties by Departments and municipalities represents 5.7 and 3.1 %, respectively. Currently in 2020, private properties by third persons still existed in 12 of the 40 lagoons, although its surface only represents a very small 3.3 % of the total surface. Before 1975, about 25 % of the lagoon surface was privately owned, but most of that has now been acquired by the *Conservatoire*. It also recovered surface from the DPM (Et. les Mouettes) following

road construction through Et. d'Ingril sud. Table 2 also list the year of the first acquisitions by the *Conservatoire* in the different lagoons. This public body currently has property in twenty of 40 lagoons (22% of the total lagoon surface), which has been designated as Public Domain of the *Conservatoire* and safeguarded for nature conservation purposes, as such being also inalienable and imprescriptible. In addition, the privately owned Et. de Biguglia was acquired by the 'Haute Corse' Department in 1994. Another aspect shown by the Figures 2, 3, 4 and 5 and Table 2 is that the area of many of the larger lagoons belong to different municipalities, up to 9 different municipalities as for Et. de Thau. The Et. de Salses-Leucate has even parts in two different Departments (Pyrenées orientales, Aude).

Discussion

The property regimes of Mediterranean coastal lagoons are remarkably variable in South France (Figs. 2, 3, 4, and 5), despite the fact that French legislation (GCPPP) exists which accommodates the status of public property as *Domaine Public Maritime* (DPM) for these ecosystems. To the best of our knowledge this is a first extensive study of property regimes of coastal lagoons in a Mediterranean country. We performed a search in web of science with the search words "Law" and "Coast" and "Property" that yielded 123 documents. A screening of these documents showed that none of them corresponded to a comparable study on property regimes of coastal lagoons. In this respect, we could only compare our study with an FAO report (Cataudella et al., 2015) that succinctly states that many of the Venetian valli in Italy have private owners; while in Albania, Greece and Tunisia, all coastal lagoons are public domain and in Egypt, four lagoons belong to the public domain and one is owned by a public company. This shows that the public property of the sea and the coastal aquatic ecosystems not only traces back to Roman law (see Introduction), but rather also presents a tradition in Islamic law (Facchini and Falque, 2012; Khalilieh, 2019). We believe that it is very important to study the property regimes of coastal lagoons as these have important implications for their management, particularly in view of increasing needs for managing these ecosystems for the conservation of habitats and species (c.f., E.U. Habitats Directive, 1992). While, some scholars from neo-liberal schools of thought argue in favour of privatization of ecosystems for biodiversity conservation, it has been shown that in most cases in the coastal zone privatization has a very negative impact both for biodiversity

conservation as well for local populations (Cabral and Aliño, 2011). However, dedicated NGO's may act as private owners with a prime objective for nature conservation. For example, the National Trust and Natuurmonumenten have acquired large natural areas along the coasts in the UK and Netherlands, respectively. In France, no large dedicated NGOs exist that acquire large areas for nature conservation purposes, while the smaller NGO ASPAS (Association pour la protection des animaux sauvages) actively acquiring properties for nature conservation purposes has no properties on the coast. Therefore, nature conservation on the French coasts has mainly relied on public policies. Hence, the *Conservatoire du Littoral* was created in 1975 to acquire cadastral parcels along the coast and safeguard them as public domain protected areas. Therefore, it is entitled to use land acquisition, bequest and expropriation procedures. Before 1980, private properties existed in 23 of the 40 coastal lagoons, representing about a quarter of the total lagoon surface. Since 1980, the *Conservatoire* also became active to acquire these private coastal lagoon properties.

How can the importance of previous private property of coastal lagoons be explained and why are property regimes still highly variable in some areas? In the introduction, we forwarded two hypotheses for explaining private property of coastal lagoons, which apparently is in conflict with the definition of the Maritime Public Domain (DPM) in the French law CGPPP. The first hypothesis, i.e. the private property existed in the past before the DPM was implemented and has been passed through inheritance, certainly applies for the Et. de Prévost and Et. de Pierre Blanche, where Church property of the diocese of Maguelone existed since the 12th century. The diocese was transferred in 1536 to Montpellier, while keeping its properties in the lagoons and surroundings. The lagoons were exploited for fisheries and salt extraction. Hence, the respect of these properties was in agreement with the jurisprudence stating that retroactivity of DPM implementation is not applicable before 1556 (Edict of Moulins). Nevertheless, these properties were confiscated during the French revolution and sold ('vente des biens nationaux' see Fig. 1) to private persons. In 1949 these private properties were bequeathed to the diocese of Montpellier and thus returned to the Church (Barruol et al., 2017). Roussillon (with Et. de Canet and part of Et. Salses-Leucate) and Corsica (7 coastal lagoons) were integrated in the Kingdom of France after 1566 and Corsica even after implementation of the DPM. Until recently, full private ownership of coastal

lagoons was complete in Corsica and prevailing in Roussillon. The private ownership existing in these territories before their annexation by France was originally respected. The Conservatoire has been particularly active in acquiring property in these two regions (Fig. 5).

The vagueness of the juridical text (Table 1), which does not cope with the full range of environmental conditions and thus conflicts with the scientific definition (Kjerfve, 1994) of coastal lagoons, has given rise to many trials at the Cassation Court during the 19th century (Fig. 1). The Navy ordonnance of Colbert defined the coastline and the sea as a public domain and included already some first descriptions on how to delimit this domain taking the astronomic and meteorological tides into account, although it did not mention the lagoons specifically. More precise procedures were introduced in 1973 by a judgment (arrêt) of the Conseil d'Etat (the Kreitmann case-law). The jurisprudence of 1848 stated that lagoons without a direct inlet and communicating with the sea through a man-made canal, do not qualify as DPM. This is in support for the second hypothesis, i.e., the legal text is not sufficiently precise to include all types of coastal lagoons and this has favoured the takeover of properties by private persons or institutions. Indeed, the immediate result of the 1848 judgement was that Et. du Grec became private property. In general, the jurisprudence implied that 6 of the 8 water bodies existing in the Palavas lagoon complex in the 19th century (Etangs du Méjean, de l'Arnel, de Vic, d'Ingril Nord, de Pierre Blanches et du Grec, see Methods) do not qualify for DPM. This explains the virtual absence of DPM in these lagoons (only a small section of Et. du Méjean is DPM) and the widespread occurrence of private state property (DPE), municipal properties and private properties (see Fig. 3). The Et. les Mouettes was created after 1950 as a result of road construction within Et. d'Ingril Sud, and currently is property of the *Conservatoire*. Natural processes, particularly accretion in deltas, may also contribute to separate the coastal lagoon from the sea. In South France, these deltas have been heavily modified by human intervention, meaning that the connection of these lagoons is now often through man-made channels. This may explain the previous widespread occurrence of private properties in the Rhône delta (Fig. 4) and in the Aude delta (Et. de Vendres, Fig. 2). In contrast to the aforementioned, other judgments by the Cassation Court during the 19th century provided the necessary support for maintaining other coastal lagoons as DPM. Hence, coastal lagoons with temporary inlets (e.g. Et. de la

Palme) and with lower salinities than seawater (mesohaline and oligohaline conditions) may qualify as DPM. On the other hand, it is surprising that the condition of naturalness of the inlet (Table 1) has only been challenged in Court a couple of times without success (e.g., C.A. Montpellier of 29 June 1849 and 6 February 1849), as nowadays most coastal lagoons in Occitanie have human-modified inlets.

Fragmented ownership of coastal lagoons is considered as highly problematic by coastal lagoon managers, particularly for those involved in nature conservation. Private ownership creates a work load for the managers, as they have to check that the different owners all respect the legislation and have to negotiate with them for other issues (e.g. Agri-environmental contracts, concertation for Natura 2000 objectives etc.). In this respect, it is very positive that the Conservatoire has acquired properties in 20 of 40 lagoons, which has resulted in reducing private lagoon property from around 25 % to the still remaining 3.3 %. The private domain of the State can also be problematic as these areas depend directly on the fiscal services of the State often without clear targets for the management of these sites. It further creates uncertainties as the private domain of the state can be sold. The public domain of the State on the coast, either the Public Maritime Domain (DPM) and the Public Domain of the *Conservatoire*, confer large advantages for nature protection as these domains are imprescriptible and inalienable. These Public Domain status represent an institutional solution for the commons, and coastal nature should indeed be considered as valuable commons. Nevertheless, while the Public Domain of the *Conservatoire* has really been created for conservation of the littoral nature commons, the DPM was not designed for this specific purpose. In addition, the DPM is not necessarily immutable as it may gain or lose surface with the shifting shoreline and infilling of coastal water bodies. Hence, the surfaces that are no longer submerged during astronomic and meteorological high tides leave the DPM, thus becoming private State property (DPE) and can then be sold to others (Hostiou, 1990). In addition, despite the inalienability, general interest can be invoked by the French State to declassify DPM into DPE (e.g., road construction through Et. d'Ingril sud, see above). The co-occurrence of the DPM and the Public Domain of the Conservatory in a coastal lagoon territory also create some difficulties for a coherent management. While the DPM is managed by the DDTM, for the management of the Public Domain of the Conservatory, by law (Law of the *Conservatoire*, 1975), this institution has to establish a

partnership with a local entity to whom it should delegate the management. Hence, because of these legal constraints, the DPM and the Public Domain of the *Conservatoire* will have different managers, which does not always facilitate a coherent approach.

Beside the fragmented property regimes of Mediterranean coastal lagoons, these ecosystems are also often located on the territories of different municipalities. Etang de Thau, which is entirely DPM (Fig. 2), is spread out over 9 municipalities. The Palavas lagoon complex with its highly fragmented property regimes (Fig. 3) covers 7 municipalities. This means that intercommunal (multi-municipal) collaboration has often been used to act as a coordinator for the management of these coastal lagoons. In practice this means that the intercommunal collaboration structures can act as the management partners of the Conservatoire and that they often hold the role of coordinator for the Natura 2000 lagoon sites. The GEMAPI law (2017), based on earlier decentralization laws, regulate the management of aquatic systems and prevention of inundations. The GEMAPI law (2017) has re-enforced the competencies of the intercommunal collaboration structures. Nevertheless, the GEMAPI law (2017) has also created institutional complications as the competences for environment have been transferred from the municipalities to larger administrative units as metropoles and agglomerations for those municipalities that are members of such units. In practice this means that for managing the coastal lagoons the metropoles and agglomerations have to collaborate with rural municipalities for the management of the lagoon ecosystems. In S. France, coastal lagoons included in the Natura 2000 network are not recognized as Marine Protected Areas (Chaboud and Galletti, 2007), but rather treated as Protected Areas on the continent. The Natural Regional Parks of the PNR Narbonnais en Méditerranée and PNR Camargue comprise many lagoons. Four major coastal lagoon areas in continental S. France (Et. Salses-Leucate, Narbonnais lagoon complex, Palavas lagoon complex and Camargue) and three lagoons in Corsica (Ets. Biguglia, Urbino and Palu) have been designated as wetlands of international importance according the Ramsar convention. Other Protected Area status also occur. Recent developments of the French environmental Code request to take ecological connectivity into account in marine and coastal spatial planning. The difficulty is now to integrate these ecological objectives into public domain law, which includes administrative legislation.

The DPM and the Public Domain of the *Conservatoire* in a coastal lagoon do not exclude human access and natural resource exploitation. The terminology developed by Ostrom and colleagues (Schlager and Ostrom, 1992; Ostrom and Hess, 2007) for the actions allowed for the different types of actors is very useful in this respect. The Law for the creation of the *Conservatoire du Littoral* (1975) requests that citizens can visit the sites of the Public Domain of the *Conservatoire*. Hence, these areas may not be completely closed as fortresses for nature conservation (In French: “*La Nature sous cloche*” approach). The modalities of the visits should of course be regulated by the managers and agreed with the *Conservatoire* in the management master plan. Hence, the citizens typically have Access *sensu* Ostrom and Hess (2007), i.e., the right to enter a defined physical area and enjoy nonsubtractive benefits (for example, hike, canoe, sit in the sun). In the DPM, human uses, e.g., shellfish farming, salt extraction and touristic infrastructure are allowed on a temporal basis only through concessions. The concession holders thus hold temporary Withdrawal rights (Ostrom and Hess, 2007). Fisheries has been traditionally regulated by a type of community-based ecosystem management through the *Prud’homies de Pêche* (Feral, 1978, Féral 1987). For this resource the fishers affiliated to the *Prud’homies de Pêche*, can be considered as Proprietors *sensu* Schlager and Ostrom (1992) who have rights of access, extraction, management of the resource and exclusion, i.e. by excluding non-members from fishing in the lagoons. In conclusion, the Public domains on the coast should be managed as commons for the French citizens and for the human population in general with a major emphasis on the conservation of habitats and species. Any exploitation should be sustainable and not impair the natural heritage. This target is supported by the EU Habitats Directive (1992), which designated coastal lagoons as a priority habitat, thus recognizing that the EU member states that collectively have a specific responsibility for the conservation of this habitat.

Coastal lagoons thus represent a valuable commons for humanity because of their biodiversity, natural and cultural heritage, and natural resources. For their efficient protection, it appears most efficient that the surfaces of these water bodies are withdrawn from the over-heated economic markets on the coast worldwide to guarantee their long-term protection. Other methods for protection include legal regulation and contract-based solutions. As shown above, the latter may create

complications for the managers when the property regimes are fragmented. Moreover, in the European Union, the Water Framework Directive recognizes water as a common resource. This creates a duality for the owner of a given water body, who owns the bottom and the sediment, but has to respect the water that exchanges along an aquatic continuum as a common good. Maritime public domain can thus present a good opportunity for environmental protection of coastal lagoons in many countries where this National State property regime is rooted in Roman and Islamic laws. However, in this paper we show that this principle was not fully applied in France and that this incongruence can be explained by a historical process. Furthermore, the example in France shows that its Maritime public domain (DPM) was historically not designed for nature protection, as this represents a demand that has emerged only since the 1970's for coastal lagoons. Hence, we call for a comparative study on legislation and property regimes of coastal lagoons and study how different countries have managed resource exploitation, conservation and adopted solutions to emerging problems and needs. As mentioned dedicated NGO's can perform a role to withdraw surfaces from economic markets for long-term nature protection, while the solution in France has been acquisition by a public body, the *Conservatoire*, with a specific mandate for nature protection. Nevertheless, on a European and global level there is very little quantitative data available concerning property regimes of coastal lagoons, implication of public law and the environmental Code, and the link with their management as protected areas. Furthermore, using the socio-ecosystems frameworks of Orstrom and Berkes it will be most interesting to study how the different rights for resource exploitation and access of these commons are regulated in national laws and customs.

Conflict of Interest

The authors declare no conflict of interest.
