Sensitivity coefficients widely used for the decomposition of seas surface pCO₂ in the open ocean (Sarmiento and Gruber, 2006; Takahashi et al., 1993) :

$$\frac{\partial pCO_2}{\partial DIC} = \frac{\overline{pCO_2}}{\overline{DIC}} \frac{3 \times \overline{ALK} \times \overline{DIC} - 2 \times \overline{DIC}^2}{(2 \times \overline{DIC} - \overline{ALK})(\overline{ALK} - \overline{DIC})} \tag{S1}$$

$$\frac{\partial pCO_2}{\partial ALK} = -\frac{\overline{pCO_2}}{\overline{ALK}} \frac{\overline{ALK}^2}{(2 \times \overline{DIC} - \overline{ALK})(\overline{ALK} - \overline{DIC})} \tag{S2}$$

$$\frac{\partial pCO_2}{\partial SST} = \overline{pCO_2} \times 0.0423 \tag{S3}$$

$$\frac{\partial pCO_2}{\partial SSS} = \frac{\overline{pCO_2}}{\overline{SSS}} \tag{S4}$$

, where the overbar represents the long-term mean value in the period of 1998-2015 at each point in space.

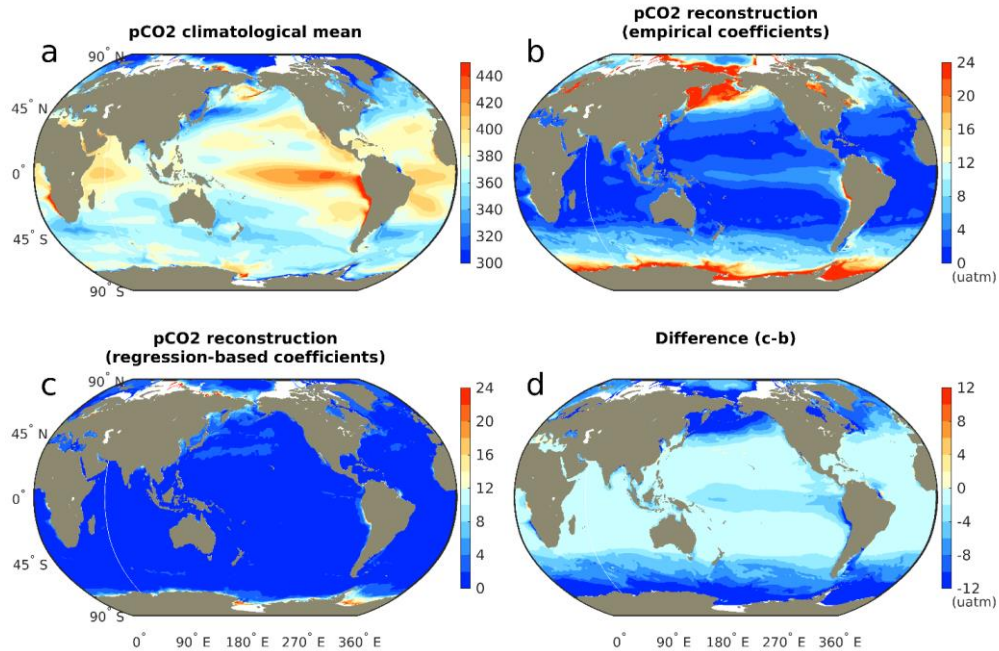
10


Figure S1: Evaluation of two ocean pCO₂ reconstruction methods using the same SST, SSS, DIC and ALK fields but different methods to derive the pCO₂ sensitivity coefficients ($\frac{\partial pCO_2}{\partial DIC}$, $\frac{\partial pCO_2}{\partial ALK}$, $\frac{\partial pCO_2}{\partial SST}$ and $\frac{\partial pCO_2}{\partial SSS}$): (a) ocean pCO₂ simulated by MOM6-COBALT, (b) bias in reconstructed pCO₂ using the approach widely used in the open ocean to compute sensitivity coefficients (Sarmiento and Gruber, 2006; Takahashi et al., 1993) and (c) bias in reconstructed pCO₂ using the regression-based approach developed in this study to compute the sensitivity coefficients (using the CO2SYS program, see section 2.3 for details). (d) difference in bias between the empirical and regression-based approaches. Biases (in µatm) are quantified using the root mean square error (RMSE) between the pCO₂ simulated by the model and the pCO₂ reconstructed from simulated monthly SST, DIC, ALK and SSS (Eq. 2).

Table S1: Spatial annual mean evaluation of MOM6-COBALT against observational data (SST, SSS, nutrients and pCO₂) for each MARCATS. A positive bias indicates higher values simulated by MOM6-COBALT. The observational SST and SSS fields are from the NOAA OI SST V2 (Reynolds et al., 2007) and the EN4 SSS (Good et al., 2013). The observational nutrients derived from the World Ocean Atlas version 2018 (Garcia et al., 2019). The bias between the pCO₂ simulated by MOM6-COBALT is also evaluated against Socatv6 and the coastal-SOM-FFN. Absolute pCO₂ biases larger than 20 µatm are highlighted in red. Blank cells values represent regions for which no observation are available in the Socatv6 database. The percentage of the MARCATS surface covered by Socatv6 observations is also presented.

MARCATS number (Mx)	MARCATS name	MARCATS category	SST (°C)	SSS (-)	NO₃	PO₄	SiO₄	pCO₂ (µatm) MOM6-COBALT vs Socatv6	pCO₂ (µatm) Coastal-SOM-FFN vs Socatv6	Evaluation against Coastal-SOM-FFN (bias) pCO₂ (µatm)	Surface covered by Socatv6 (%)

Table S2: Seasonal evaluation of MOM6-COBALT against observations (SST, SSS, nutrients and pCO₂) for each MARCATS. The observational SST and SSS fields are from the NOAA OI SST V2 (Reynolds et al., 2007) and the EN4 SSS (Good et al., 2013). The observational nutrients derived from the World Ocean Atlas version 2018 (Garcia et al., 2019).The evaluation is performed on their seasonal amplitude which is expressed as the bias between the RMS of their amplitude. A positive value indicates higher values simulated by MOM6-COBALT compared to observations. The seasonal evaluation is also performed on their seasonal cycles which is represented by the Pearson correlation coefficient. A Pearson correlation coefficient value of 1 indicates that both signals are perfectly in phase with one another while a value of -1 represents a complete phase shift. Pearson correlation coefficient < 0.5 for pCO₂ are highlighted in red. The seasonal pCO₂ simulated by MOM6-COBALT is evaluated against coastal-SOM-FFN.
