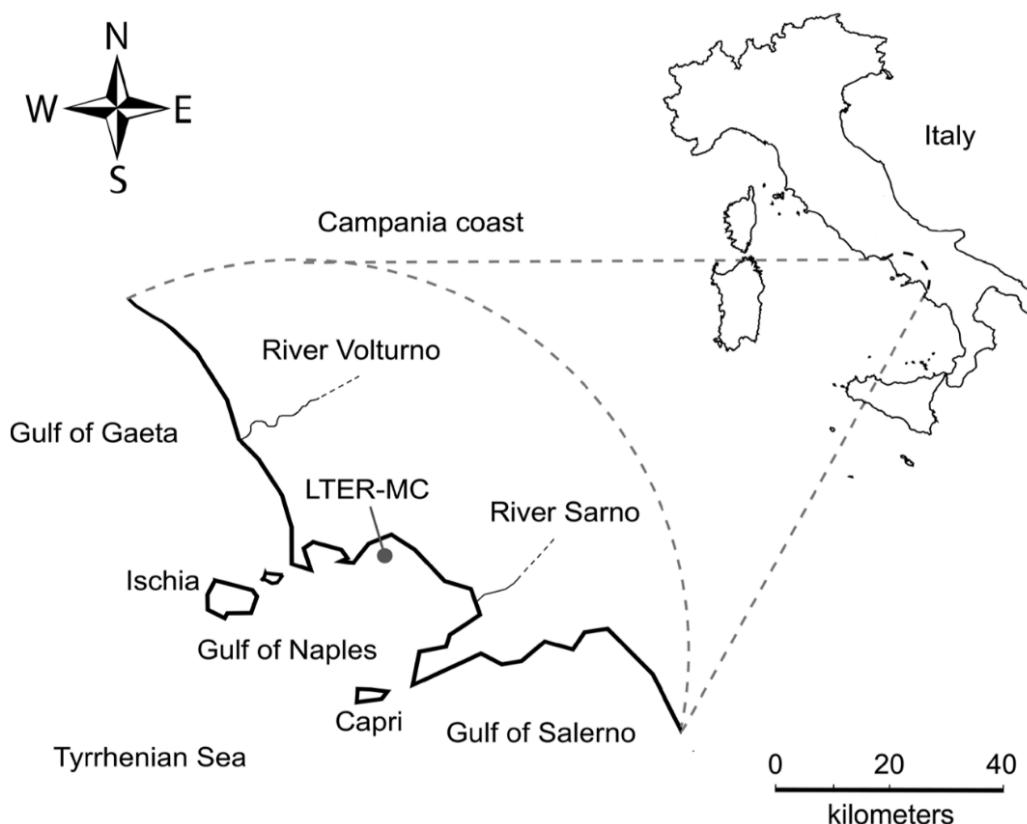

Figure S1. Map of the Gulf of Naples with the location of LTER-MC sampling station. Taken from Zingone et al. (2019).

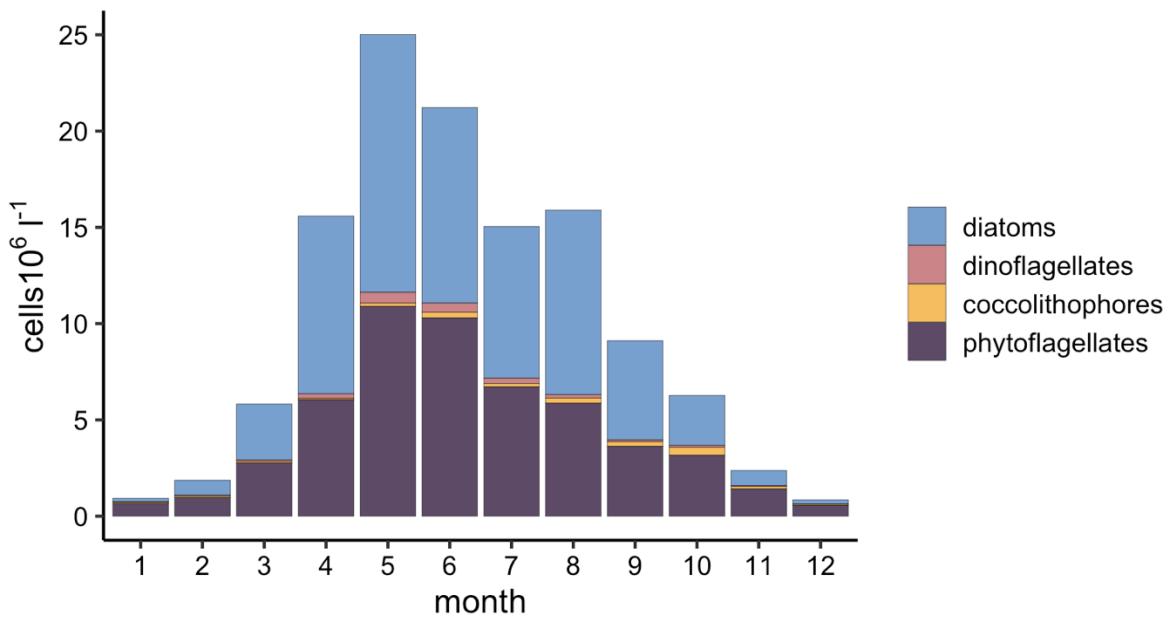

Figure S2. Monthly average abundance of surface phytoplankton functional groups (diatoms, phytoflagellates, dinoflagellates and coccolithophores) at LTER-MC during 1984-2015.

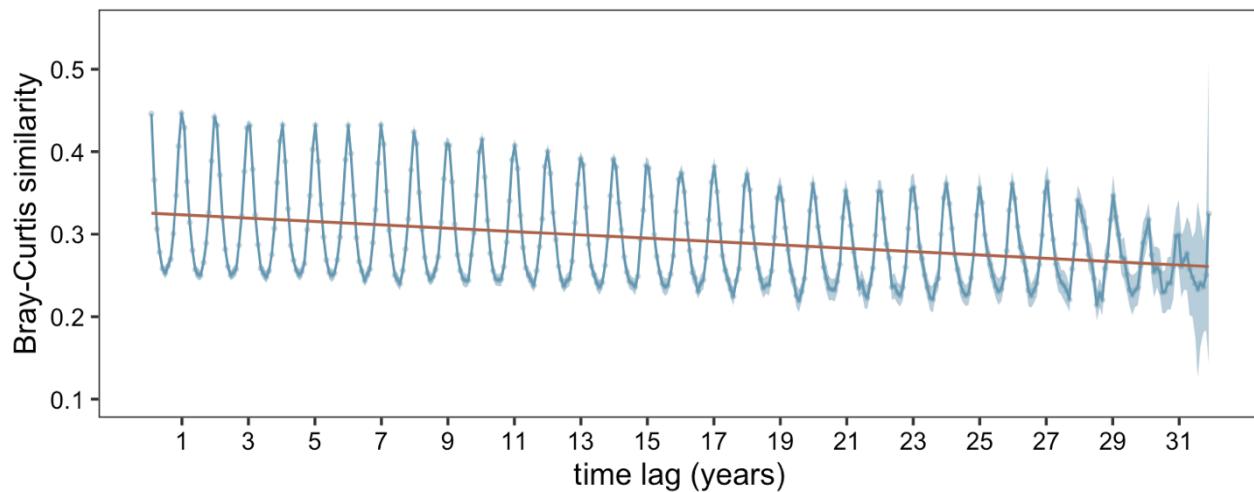

Figure S3. Interannual recurrence of phytoplankton communities shown by average. Bray–Curtis similarities (0: completely different communities; 1: identical communities; shaded area: 95% confidence interval) between all pairs of weekly samples separated by a given number of months of the series (time lag, x axis) during 1984–2015. The first point of the series represents the average and 95% confidence interval of the Bray–Curtis similarity values among communities sampled 30 ± 4 days apart in the time interval considered. Similarly, the second point represents the average Bray–Curtis similarity among all the communities sampled 60 ± 4 days apart, the point at 1 year is the average similarity among all the communities sampled at 360 ± 4 days apart, and so on. The decay of maximum and minimum average similarity values over time is probably influenced by the lower number of samples to compare for time lags of many years.

Table S1. Main statistics and results of periodicity' significance test of phytoplankton species during 1984-2015. The relative frequency and the average abundance are the proportion of the number of species' presences and the mean cell counts calculated over all samples respectively.

Taxa	Functional group	Phylum	Class	Lomb-Scargle' significance test	Relative frequency (%)	Average abundance (cells mL ⁻¹)	SD average abundance (cells mL ⁻¹)
<i>Emiliania huxleyi</i>	coccolithophores	Haptophyta	Prymniosiophyceae	periodic	81.11	99.841	444.918
